çēr′-a-sŭs, *s.* [Lat., from Gr. *κέρασος* (*kerasos*) = a cherry-tree.]

Bot.: The Cherry-tree, a genus of trees of the order Amygdalaceæ. Three species are British—(1) *Cerasus vulgaris*, called also *Prunus cerasus*, the Dwarf Cherry; (2) *C. Avium*, called also *Prunus Avium*, the Gean, and (3) *Cerasus Padus*, called also *Lauro-cerasus Padus* and *Prunus Padus*, the Bird Cherry. Hooker considers Nos. 1 and 2 mere varieties of each other. The first of these is generally supposed to have originated the Garden Cherry, and the second the Morella. The leaves, bark, and fruit of *Cerasus Lauro-cerasus* (the Common Laurel), and the oil derived from them, are virulent poisons, owing to the amount of prussic acid which they contain. For a similar reason *C. capricida*, of Nepaul, kills, as the Latin specific name imports, the goats of that region. *C. Padus* and *C. virginiana* have the deleterious property in less measure. All the species of Cerasus yield a gum analogous to gum tragacanth. The leaves of *Cerasus Avium* have been used as a substitute for tea. A variety of the same tree is used in the Vosges and in the Black Forest in the preparation of the liquor called "Kirschwasser." The kernel of *C. occidentalis*, a West Indian species, is employed in flavouring the liquor called "Noyau." The bark of *Cerasus virginiana* is prescribed as a febrifuge. So also is that of *C. capollim* of Mexico. [Cherry.]

Bot.: A common genus of plants. Tribe, Bauhinieæ. *Cercis siliquastrum* is a tree, a native of the South of Europe, and of several countries in Asia. It is a handsome low tree with a spreading head. The leaves are remarkable for their unusual shape; they are of a pale, bluish-green colour on the upper side, and sea-green on the under. The flowers have an agreeable acid taste, and are mixed in salads, and the flower-buds are pickled. It has received the name of the Judas-tree, from the tradition that it was upon a plant of it, near Jerusalem, that the traitor Judas hanged himself.

† **çĕr'-ĕ-bĕl** (*Eng.*), **çĕr-ĕ-bĕl'-lŭm** (*Lat.*), *s.* [Lat. *cerebellum* = a little brain, dim. of *cerebrum* = a brain.]

1. *Anat.:* A portion of the brain situated beneath the posterior lobes of the cerebrum, and about one-seventh the size of the latter, from which it is protected by the *tentorium cerebelli.* It is composed of grey matter on the surface and white in the interior. In shape the cerebellum is oblong and flattened, largest from side to side, and divided into two hemispheres, separated on the upper surface by the superior vermiform process; on the under surface there is a deep fissure termed the vallecula or valley, corresponding with the medulla oblongata. On making a vertical incision the arbor vitæ cerebelli is seen, the white central substance resembling the trunk of a tree with branches, branchlets, and leaves. Nearer the commissure than to the lateral border is a yellowish grey dentated line, the corpus rhomboideum, or ganglion of the cerebellum. The cerebellum is associated with the rest of the brain by three pairs of rounded peduncles or cords, the superior proceeding forwards and upwards to the testes, forming the anterior part of the lateral boundaries of the fourth ventricle with the valve of Vieussens between them; the middle, the largest, are lost in the pons varolii, and the inferior descend to the posterior part of the medulla oblongata, and form the inferior portion of the lateral boundaries of the fourth ventricle.

2. *Physiol.:* It is connected with the powers of motion, and is largest in those animals which require the combined effort of a great variety of muscles to maintain their usual position and execute their ordinary movements. It does not appear to affect voluntary power, or reflex movements, but chiefly combined motor action. According to Dr. Ferrier the cerebellum is the co-ordinating centre for the muscles of the eyeball. In the system of phrenologists, first propounded by Gall, it is the organ of the sexual instinct, and Dr. Carpenter says it seems not improbable that the lobes of the cerebellum are the parts specially concerned in the regulation of muscular movements, whilst the central portion may be the seat of the sexual sensations. This view is, however, not generally held.

çĕr-ĕ-brī'-tĭs, *s.* [From Lat. *cerebr(um)* = the brain, and Lat. & Gr. suff. *-itis*, denoting inflammation.]

Med.: Inflammation of the substance of the brain. Cerebritis may be either acute or chronic. The acute form of the disease runs a very rapid course and usually terminates fatally. The symptoms are as follows, viz., a deep-seated, violent, oppressive, and persistent pain in the head, with some feverishness and vomiting, pallor of the face, low and irregular pulse, depression of spirits, confusion of thought, then convulsions, loss of sensation, paralysis, coma, and death. Chronic cerebritis, to which the term ramollisement or softening of the brain is frequently applied, is usually of a local or partial character, and is consequently much slower in its progress. This form of the disease, which may or may not be a sequence of the acute, is characterised by certain well-marked symptoms such as loss of memory, failing intellectual powers with a consciousness of the decline, dull and protracted pain in the head, tingling or numbness in different parts of the body, impairment of the faculties of sight and hearing, and paralysis slowly increasing. Cerebritis is usually associated with meningitis, or inflammation of the membranes of the brain, and is then called Encephalitis. When this complication occurs the symptoms just described are of a more marked character. [BRAIN-FEVER.]

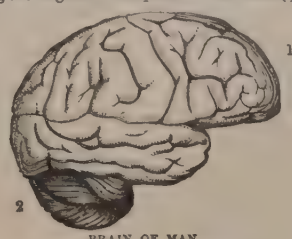
çĕr'-ĕ-brŭm, çĕ-rē'-brŭm, *s.* [Lat. *cerebrum* = the brain.]

1. *Anat.:* The higher and front portion of the brain, as opposed to the cerebellum, the hinder and lower portion. The cerebrum is composed of a number of convolutions externally, and divided superiorly by the great longitudinal fissure, containing the *falx cerebri*, and marking the original development of the brain (q.v.),



BRAIN OF MAN.
1. Cerebrum. 2. Cerebellum.

into two symmetrical halves, which are connected by a broad band of white substance, the corpus callosum. If either hemisphere be cut through, a centre of white substance will be found surrounded by a grey border, following the zigzag of the sulci and convolutions. Each hemisphere is divided into an anterior, middle, and posterior lobe; the anterior rests on the roof of the orbit, and is separated by the fissure of Sylvius from the middle lobe, which lies in the middle fossæ of the base of the skull, and is separated from the posterior at the ridge of the petrous bone; the posterior rests on the tentorium. On the middle line of the corpus callosum is the raphe, a linear depression, and a section on each side of it exposes the ventricles (q.v.) extending from one end of the hemispheres to the other.

2. *Physiol.:* According to Dr. Ferrier — (1) The anterior portions of the cerebral hemispheres are the chief centres of voluntary motion and of the active outward manifestations of intelligence. (2) Individual convolutions are separate and distinct centres; and in certain groups of convolutions are localised the centres for various movements—*e.g.*, eyelids, face, mouth, tongue, ear, neck, hand, foot, and tail of animals. (3) The action of the hemisphere is in general crossed; but certain movements of the mouth, tongue, and neck are bilaterally co-ordinated from each cerebral hemisphere.

çër′-ĭ-ŭm, *s.* [Named by the discoverers after Ceres.]

Chem.: A metal (Sym. Ce.; At. Wt., 92) found with two other metals, lanthanum and didymium, in cerite. Powdered cerite is made into a thick paste with concentrated sulphuric acid, and heated nearly to redness. The mass is then treated with water, saturated with H_2S, filtered, acidified with HCl, and precipitated by oxalic acid. This precipitate heated in the air to redness gives a brown powder of the mixed oxides. Nitric acid dissolves the oxides of lanthanum and didymium, and leaves the oxides of cerium. The oxides of lanthanum and didymium are separated by the repeated crystallization of their sulphates (see Watts's *Dict. of Chemistry*). Cerium is obtained by reducing its chloride with sodium as a grey powder which decomposes water slowly. It dissolves in dilute acids with evolution of hydrogen. Cerous oxide, CeO, obtained by igniting the carbonate or oxalate, is a greyish-blue powder, which, in the air, oxidises into ceroso-ceric oxide, Ce_3O_4, a yellowish-white powder. The salts of the former are colourless, those of the latter brown-red or yellow.

A fact is *certain*, a person's step is *sure*, a house is *secure. Certain* is opposed to dubious, *sure* to wavering, *secure* to dangerous. A person is *certain* who has no doubt remaining in his mind; he is *sure* when his conviction is steady and unchangeable; he is *secure* when the prospect of danger is removed. When applied to things, *certain* is opposed to what is varying and irregular; *sure* to what is unerring; *secure* is used only in its natural sense. It is a defect in the English language, that there are at present no *certain* rules for its orthography or pronunciation; the learner, therefore, is at a loss for a *sure* guide. Amidst opposing statements it is difficult to *ascertain* the real state of the case. No one can *ensure* his life for a moment, or *secure* his property from the contingencies to which all sublunary things are exposed." (*Crabb: Eng. Synon.*)

¶ Crabb thus distinguishes between *cessation, stop, rest,* and *intermission:* "To *cease* respects the course of things; whatever does not go on has *ceased;* things *cease* of themselves: *stop* respects some external action or influence; nothing *stops* but what is supposed to be *stopped* or hindered by another: *rest* is a species of *cessation* that regards labour or exertion; whatever does not move or exert itself is at *rest: intermission* is a species of *cessation* only for a time or at certain intervals. They are formed to project the chain-plate, and give the lower rigging greater outrig or spread, free from the topsides of the ship, thus affording greater security and support to the masts, as well as to prevent the shrouds from damaging the gunwale, or being hurt by rubbing against it. Of course they are respectively designated fore, main, and mizzen. They are now discontinued in many ships, the eyes being secured to the timber-heads, and frequently within the gunwale to the stringers or lower shelf-pieces above the water-way. *In the chains* applies to the leadsman, who stands on the channels between two shrouds to heave the hand-lead.

". . . tossed it into the main *chains*, to the man who had thrown the stern-fast."—*Marryat: Midship. Easy.*

4. *Weaving:* The warp threads of a web It is called also *fitting* or *hoist*, and in the case of silk it is denominated organzine.

¶ Crabb thus distinguishes between a *chain*, a *fetter*, a *band*, and a *shackle*:—"All these terms designate the instrument by which animals or men are confined. *Chain* is general and indefinite; all the rest are *chains:* but there are many *chains* which do not come under the other names, a *chain* is indefinite as to its make; it is made generally of iron rings, but of different sizes and shapes: *fetters* are larger, they consist of many stout *chains: bands* are in general any thing which confines the body or the limbs; they may be either *chains* or even cords: *shackle* is that species of *chain* which goes on the legs to confine them; malefactors of the worst order have *fetters* on different parts of their bodies, and *shackles* on their legs. These terms may all be used figuratively. The substantive *chain* is applied to whatever hangs together like a *chain*, as a *chain* of events; but the verb *to chain* signifies to confine as with a *chain:* thus the mind is *chained* to rules, according to the opinions of the free-thinkers, when men adhere strictly to rule and order; and to represent the slavery of conforming to the establishment, they tell us we are *fettered* by systems. *Band* in the figurative sense is applied, particularly in poetry, to every thing which is supposed to serve the purpose of a *band;* thus love is said to have its silken *bands*. *Shackle*, whether as a substantive or a verb, retains the idea of controlling the movements of the person, not in his body only, but also in his mind and in his moral conduct; thus a man who commences life with a borrowed capital is *shackled* in his commercial concerns by the interest he has to pay, and the obligations he has to discharge." (*Crabb: Eng. Synon.*)

¶ *Chain of locks:*

chain-cable, *s.*

Naut.: A cable made of iron links. They are not new; Cæsar found them on the shores of the British Channel. Smyth, in his *Sailor's Word-Book*, says that in 1818 he saw upwards of eighty sail of vessels with them at Desenzano, on the Lago di Garda. They have all but superseded hemp cables in recent times; they are divided into parts fifteen fathoms in length, which are connected by shackles, any one of which may be slipped in emergency; at each 7½ fathoms a swivel used to be inserted, but in many cases they are now dispensed with. Chain-cables were made in England by machinery in 1792, and introduced into the British merchant-service by Captain Brown of the "Penelope," West India merchantman, 400 tons burden, 1811. The cable had twisted links. Chain-cables are generally made in lengths of from 12½ to 25 fathoms; each length is usually provided with a swivel. The lengths are joined together by shackles (q.v.). A cable's-length is 100 fathoms of 6·08 feet each, and is one-tenth of a nautical mile. Chain-cables are stowed in chain-lockers, generally near the mainmast, or just before the engine and boiler compartment. The locker-space required may be found by the following rule: Multiply the square of the diameter of the cable-iron in inches by 35. The product is the space required in cubic feet, nearly. Four kinds of apparatus are used for regulating or checking the motion of the cable as it runs towards the hawse-holes, and for holding on by the cable after the anchor has taken hold. These are Controllers, Bitts, Stoppers, Compressors (q.v.).

Chain-cable compressor: A curved arm of iron which revolves on a bolt through an eye at one end. At the other is a larger eye in which a tackle is hooked; it is used to bind the cable against the pipe through which it is passing and check it from running out too quickly.

Chaldaic Christians, *s. pl.* [So named because their head church is in what was anciently termed Chaldea.]

Ch. Hist.: The chief name given in the East to the interesting sect more commonly known in the West as Nestorians. In parts of India they are called St. Thomas Christians, from the erroneous notion that they were first converted to Christianity by the Apostle Thomas. Their patriarch resides in a monastery near Mosul, not far from the site of ancient Nineveh. Like Nestorius, they attribute to Jesus two natures, each with its own personality. They reject image worship. In their liturgic services they employ the Syriac language. When first they arose, in the fifth century, they were persecuted by the Eastern Church, but after the rise of the Arabian "prophet" they found favour with the Mohammedans, whose policy it was to support all detached sects against the Catholic Church which they feared. Afterwards they became so noted for missionary work as to elicit the admiration even of the historian Gibbon. Within the present century they have suffered severely from Mohammedan fanaticism. American and other missionaries have also diffused Protestantism among them. One of these Americans, Rev. Asahel Grant, wrote a book which excited some attention, in which he maintained that the "Nestorians" were originally of Jewish descent, deriving their origin from the ten lost tribes.

II. *Technically:*

1. *Min. & Chem.:* A massive, opaque carbonate of lime, of a white, greyish, or yellowish colour, with an earthy fracture. Sp. gr., 1·8—2·8. Dana places it along with calcareous marl, under the heading soft, compact limestone, constituting his 21st variety of the mineral species Calcite. It forms extensive rocks in the south and south-east of England.

2. *Geology and Palæontology:*

(1) *Spec.:* A rock which, when pure, as it often is, is made up of the constituents given under II. 1 *Min.* (q.v.). A great belt of it crosses England diagonally from the eastern to the southern coast, and it is impossible to approach London from the east, west, north, or south without having chalk rocks, at a distance often very limited, beneath one's feet. Their appearance is familiar, owing to their being conspicuously displayed in the chalk cliffs of Dover, and in various chalk pits in the southern counties, on the escarpments on the sides of the Northern and Southern Downs [DOWNS] and in railway cuttings. The chalk, properly so called, consists of the highest portion of the Upper Cretaceous System, and is divided into Upper White Chalk with Flints and Lower White Chalk without Flints. [FLINT, *Geol.*] The larger animal fossils of the White Chalk consist of Crinoids and other Echinoderms; Cephalopod Molluscs, specially Ammonites, Baculites, Belemnites; Brachiopods, such as Terebratulæ, &c.; of other Molluscs, Rudistidæ, &c.; of fish, teeth of Cestracionts; of reptiles, Pterodactyls, Turtles, and Oviparous Saurians. Of the smaller organisms, Globigerinæ, and other Foraminifers abound; in fact, chalk is mainly composed of these cemented together by a calcareous paste. The examination by Sir Leopold McClintock, Dr. Carpenter, Sir Wyville Thomson, Prof. Huxley, Dr. Wallich, and others, of the Atlantic ooze obtained in connection with the laying of the telegraphic cable to America, and in the subsequent exploratory expeditions of the Porcupine, Challenger, &c., have shown that the ooze now being deposited at a depth of from 5,000 to more than 15,000 feet in the Atlantic is essentially chalk, with Globigerinæ and other Forminifers, the former apparently identical with existing species. Most other organisms are extinct, though a few are not. This discovery does not shorten by an hour the period which has elapsed since the chalk first began to be formed, but only proves that a process which was thought to have terminated or intermitted, still goes on. As chalk is a deep-sea formation the vegetable fossils of the Chalk rocks are unimportant.

(2) *Gen.:* The Cretaceous rocks in general, whatever their actual composition. [CRETACEOUS FORMATION OR SYSTEM.]

3. *Comm.:* When purified, chalk is called whiting and Spanish white in England. Pure chalk should dissolve readily in dilute muriatic acid, and the solution should afford no precipitate with water of ammonia. Chalk is burnt into lime in great quantities, in which state it is used as a manure, and for making mortar and whitewash.

"*Chalk* is of two sorts; the hard, dry, strong *chalk*, which is best for lime; and a soft unctuous *chalk*, which is best for lands."—*Mortimer.*

2. *Comm.* (*Shammy, Chamois-leather*): The name indicates that this leather is made from the skin of the Chamois (*Rupicapra tragus*), but the skins of sheep, goats, deer, calves, and the split hides of other animals, are used for making this kind of leather; the superior kinds of which are called *chamois*, and the inferior, *wash-leather*. The skins are unhaired in a lime-vat, and scraped on a beam in the ordinary way. The lime is removed in a bath by lactic or acetic acid, and the skins are then *frizzed*. This process consists in rubbing the skins with pumice or the blunt end of a round knife, until the grain is removed, the skin softened, and reduced to an even thickness throughout. The skins are then pressed to expel water, fulled by wooden hammers, spread, treated with oil—fish-oil being preferable—rolled up and again fulled, to distribute the oil throughout the bundle. They are then taken out, unfolded, dried, re-oiled, and again rolled and fulled. These processes are repeated till the effect is fully accomplished, heat being applied during the latter portion, by means of suspending the skins in a storeroom. Superfluous oil is removed by a short steeping in a dilute alkaline lye; the skins are then wrung, dried, suppled by stretching, and polished by rolling. (*Knight.*)

They are either sweet or dry, according to the extent to which fermentation has been carried. In the manufacture of Champagne black grapes of the first quality are usually employed. The breakage of the bottles in these sparkling wines amounts frequently to thirty per cent. Much of the Champagne sold is a spurious imitation, being manufactured from a cheap white wine sweetened with sugar, and coloured. Sometimes it consists entirely of wine made from gooseberries or rhubarb sweetened, and charged with carbonic-acid gas. The Champagnes produced in California are considered equal to those of Europe.

* II. *Law:* One who maintained a cause by wager of battle. When a tenant in a writ of right pled the general issue, *i.e.*, that he had more right to hold than the demandant to recover, and offered to prove it by the body of his champion, the demandant had the option of refusing or accepting the proposal. If he did the latter, then the tenant's champion being produced threw down his gage or glove, which his opponent's champion took up. A piece of ground, sixty feet square, was then enclosed with lists. Within it the champions, if brave enough, fought till the stars appeared; and if the champion of the tenant held his own till that time, he gained the victory for his employer or friend, while if vanquished the land for which he contended was lost. Sometimes the fight was terminated prematurely by one of the champions proving "recreant," and pronouncing what Blackstone calls "the horrible word 'craven.'" The man who did so was believed to be permanently disgraced, and was never in future put on a jury, or even allowed to appear as a witness in a court of law.

"... the art of catching the tone of any society into which *chance* might throw him."—*Macaulay: Hist. Eng.*, ch. xii.

4. The quality of being without any defined or recognised cause; fortuity.

"*Chance* is but a mere name, and really nothing in itself; a conception of our minds, and only a compendious way of speaking, whereby we would express, that such effects as are commonly attributed to *chance*, were verily produced by their true and proper causes, but without their design to produce them."—*Bentley*

5. The event, success, or result of things.

"Turne we our steeds; that both in equall tilt
May meete againe, and each take happy *chaunce*."
Spenser: F. Q., III. viii. 18.

6. An unlucky event; misfortune, ill-luck.

"You were us'd
To say extremity was the trier of spirits,
That common *chances* common men could bear."
Shakesp.: Coriolanus, iv. 1.

7. The possibility or probability of any occurrence.

"Thus he taught the game of hazard,
Thus displayed it and explained it,
Running through its various *chances*."
Longfellow: The Song of Hiawatha, xvi.

8. An opportunity offered.

¶ *The last chance:* The last remaining hope.

The main chance: The principal or most important opportunity offered to one.

To take care of or *mind the main chance:* To watch one's best opportunity to look after oneself, or one's own interests, before those of others.

¶ (1) After pointing out the heathenish character of the three words *chance*, *fortune*, and *fate*, Crabb thus distinguishes between them:—"In this ordinary sense *chance* is the generic, *fortune* and *fate* are specific terms: *chance* applies to all things personal or otherwise; *fortune* and *fate* are mostly said of that which is personal. *Chance* neither forms orders or designs; neither knowledge or intention is attributed to it; its events are uncertain and variable: *fortune* forms plans and designs, but without choice; we attribute to it an intention without discernment; it is said to be blind: *fate* forms plans and chains of causes; intention, knowledge, and power are attributed to it; its views are fixed, its results decisive. A person goes as *chance* directs him when he has no express object to determine his choice one way or other; his *fortune* favours him, if without any expectation he gets the thing he wishes; his *fate* wills it, if he reaches the desired point contrary to what he intended. Men's success in their undertakings depends oftener on *chance* than on their ability [?]; we are ever ready to ascribe to ourselves what we owe to our good *fortune;* it is the *fate* of some men to fail in every thing they undertake."

(2) *Chance* and *probability* are thus discriminated:—"These terms are both employed in forming an estimate of future events; but the *chance* is either for or against; the *probability* is always for a thing; a *chance* is but a degree of probability."

(3) The following are stated to be the differences between *chance* and *hazard*:—"Both these terms are employed to mark the course of future events, which is not discernible by the human eye. With the Deity there is neither *chance* nor *hazard*; His plans are the result of omniscience, but the designs and actions of men are all dependant on *chance* or *hazard*. *Chance* may be favourable or unfavourable, more commonly the former; *hazard* is always unfavourable; it is properly a species of *chance*. There is a *chance* either of gaining or losing: there is a *hazard* of losing."

(4) The following are the differences between *accident* and *chance*. "... *Accident* and *chance* may be used indifferently in the colloquial expression to happen by chance or by accident; but the word *accident* is used only in respect to particular events, as it was pure *accident;* but *chance* is employed to denote a hidden senseless cause of things as opposed to a positive intelligent cause." (*Crabb: Eng. Synon.*)

(5) The *Penny Cyclopædia* states briefly and pointedly that the word *chance* has been used in two senses, as opposed to providence and as opposed to certainty.

B. *As adj.:* Happening accidentally; casual, accidental, fortuitous.

"Now should they part, malicious tongues would say,
They met like *chance* companions on the way."
Dryden.

* **C.** *As adv.:* Perchance, accidentally, fortuitously, unexpectedly.

2. *Law:* The casual slaughter of a man, not altogether without the fault of the slayer, when ignorance or negligence is joined with the chance; as if a man lop trees by a high-way-side, by which many usually travel, and cast down a bough, not giving warning to take heed thereof, by which bough one passing by is slain: in this case he offends, because he gave no warning, that the party might have taken heed to himself.

"But the self-defence, which we are now speaking of, is that whereby a man may protect himself from an assault, or the like, in the course of a sudden brawl or quarrel, by killing him who assaults him. And this is what the law expresses by the word *chance-medley*, or (as some rather choose to write it), *chaud-medley*, the former of which in its etymology signifies a casual affray, the latter an affray in the heat of blood or passion; both of them of pretty much the same import."—*Blackstone: Commentaries*, b. iv., c. 14.

Class. Lat. *cancelli* = an enclosure of wood, a railing, lattice, &c.; pl. of *cancellus* = a grating; dimin. of *cancer* = a crab.]

I. *In ancient times:*

* **1.** *Originally (in the Roman Empire):* A petty officer stationed at the fence of bars or lattice-work in a law-court, to introduce such functionaries as were entitled to pass inside. The Emperor Carinus, the immediate predecessor of Diocletian, gave great offence by making such a cancellarius prefect of Rome.

* **2.** *Next (in the Eastern Empire):* A secretary who sat inside the lattice-work to write, but who, in the lower empire, was invested also with judicial functions, and ultimately with a superintendence over the other officers of the empire. From this high dignity to that of a modern English Lord Chancellor the transition is easy.

3. *Then (in the Church of Rome during mediæval times):* An officer standing to the bishop much in the same relation as the cancellarius of the lower empire did to the emperor.

II. *In more modern times:*

1. *On the Continent:* An officer of the highest rank, with a certain jurisdiction over other civil functionaries. The powers of the chancellor, however, varied in the different nations.

2. *In England:*

(1) *In the Civil Government:* A name applied

to various functionaries, some of them of very high rank; viz., to—

(*a*) *The Lord Chancellor:* Originally he was the king's chief secretary, to whom petitions were referred, whence he was called *referendarius*. This title subsequently gave place to chancellor, which first occurs, according to Selden, in English history about A.D. 920. Being generally an ecclesiastic, he became keeper of the king's conscience. Having to express the sovereign's views in cases appealed to him from the Courts of Law, he gradually acquired a great legal standing himself, and finally developed into the potent personage now denominated the Lord Chancellor, or more fully the Lord High Chancellor. He is now the highest judicial functionary in the kingdom, and ranks above every temporal lord, excepting those of the blood royal; he is also above every spiritual lord, except the Archbishop of Canterbury; he is keeper of the great seal; he presides in the House of Lords, of which he is prolocutor; he is a cabinet minister and privy councillor; presides in what was the Court of Chancery (once spelled *chancelry*), but is now the Chancery Division of the Supreme Court; appoints all justices of the peace throughout the kingdom; is the general guardian of all infants, idiots, and lunatics; visitor of the hospitals and colleges of royal foundation; and patron of all livings under twenty marks in value. He goes out with the ministry of which he is a member.

(*b*) *Chancellor of the Exchequer:* Properly, the under-treasurer of the Exchequer, the head treasurership being held, not by an individual, but by the Lords Commissioners of the Treasury. The Chancellor has, however, a very powerful voice in connection with the Exchequer. He must be in the House of Commons, and may be its leader, and also Prime Minister.

(*c*) *Chancellor of the Duchy of Lancaster:* An officer who presides, either himself or by deputy, in the Duchy Chamber of Lancaster, deciding on all matters of equity connected with lands held of the crown in that Duchy.

(2) *In the Universities:* The titular head of a university. The office is only honorary. Under him is a Vice-Chancellor, who is the actual working head.

(3) *In the Church:* Specially two kinds of officers, viz.:—

(*a*) *Chancellor of a Cathedral:* One of the four chief dignitaries in the cathedrals of old foundation.

(*b*) *Chancellor of a Diocese or of its Bishop:* A law officer who acts as vicar-general for the bishop, and holds courts for him to decide on cases tried by ecclesiastical law.

(4) *In Heraldry:* A functionary, viz., *the Chancellor of the Order of the Garter*, or other military orders. An officer who acts as secretary to the order, sealing the commissions and mandates of the Assembly of the Knights.

3. *In Scotland:* Till the Union, in 1707, there was a Chancellor of Scotland, who was the head of law as well as equity, thus having gained a step beyond what the English Lord High Chancellor had attained, he being specially head in equity, though with superiority to the judges in law. There are also a Chancellor and Vice-Chancellor in each of the Scottish Universities. The foreman of a jury was also sometimes called its chancellor. (*Scott: Heart of Midlothian.*)

4. *In Ireland:* There is a Lord High Chancellor of Ireland. There are Chancellors and Vice-Chancellors in the Irish Universities and colleges.

* 5. A secretary.

"One Gilbert Peck, his *chancellor*." — *Shakesp.: Henry VIII.*, i. 1.

Fr. *chancellerie, chancelrie* = "a chancery court, the chancery, seale office, or court of every parliament" (*Cotgrave*); from Low Lat. *cancellaria* = a place where records are kept, a record-office of a chancellor, from *cancellarius* = a chancellor.]

A. *As substantive:*

1. The Court of Chancery was the highest court of judicature next to the House of Lords. The Lord Chancellor presided in this court, having under him the Lords Justices and Vice-Chancellors, who act for him in separate courts, and the Master of the Rolls, who had the keeping of all the rolls and records of the Court of Chancery, and also presided in a court of his own. The Court of Chancery was a court of equity. Under the Judicature Act of 1873 the powers and jurisdiction of the Court of Chancery were transferred to the High Court of Justice, and it now exists as the chancery division of that court. In the United States there are Courts of Chancery in several of the original thirteen states, but in most of the states the principles of equity are administered in the higher courts of law.

¶ (1) Crabb thus distinguishes between *to change, to alter,* and *to vary:*—We *change* a thing by putting another in its place; we *alter* a thing by making it different from what it was before; we *vary* it by *altering* it in different manners and at different times. We *change* our clothes whenever we put on others: the tailor *alters* the clothes which are found not to fit, and he *varies* the fashion of making them whenever he makes new . . . A thing is *changed* without *altering* its kind; it is *altered* without destroying its identity, and it is *varied* without destroying the similarity."

(2) He thus discriminates between *to change, to exchange, to barter,* and *to substitute:*—"The idea of putting one thing in the place of another is common to all these terms, which varies in the manner and the object. *Change* is the generic, the rest are specific terms: whatever is *exchanged, bartered,* or *substituted,* is changed; but not *vice versâ. Change* is applied in general to things of the same kind, or of different kinds; *exchange* to articles of property or possession; *barter* to all articles of merchandise; *substitute* to all matters of service and office. Things rather than persons are the proper objects for *changing* and *exchanging,* although whatever one has a control over may be *changed,* or *exchanged;* a king may *change* his ministers; governments *exchange* prisoners of war. Things only are the proper objects for *barter;* but, to the shame of humanity, there are to be found people who will *barter* their countrymen, and even their relatives, for a paltry trinket. *Substituting* may either have persons or things for an object; one man may be *substituted* for another, or one word *substituted* for another. The act of *changing* or *substituting* requires but one person for an agent; that of *exchanging* and *bartering* requires two: a person *changes* his things or *substitutes* one for another; but one person *exchanges* or *barters* with another. *Change* is used likewise intransitively, the others always transitively; things *change* of themselves, but persons always *exchange, barter,* or *substitute* things . . In the figurative application these terms bear the same analogy to each other. A person *changes* his opinions; but a proneness to such *changes* evinces a want of firmness in the character. The good king at his death *exchanges* a temporal for an eternal crown. The mercenary trader *barters* his conscience for paltry pelf. Men of dogmatical tempers *substitute* assertion for proof, and abuse for argument." (*Crabb: Eng. Synon.*)

¶ (1) Crabb thus distinguishes between *character* and *letter*: "*Character* is to *letter* as the genus to the species: every *letter* is a *character*; but every *character* is not a *letter*. *Character* is any printed mark that serves to designate something; a *letter* is a species of *character* which is the constituted part of a word. Short-hand and hieroglyphics consist of *characters*, but not of letters. *Character* is employed figuratively, but *letter* is not. A grateful person has the favours which are conferred upon him written in indelible *characters* upon his heart."

(2) He thus discriminates between *character* and *reputation*:—"*Character* lies in the man; it is the mark of what he is; it shows itself upon all occasions: *reputation* depends upon others; it is what they think of him. A *character* is given particularly: a *reputation* is formed generally. Individuals give a *character* of another from personal knowledge: public opinion constitute the *reputation*. *Character* has always some foundation; it is a positive description of something: *reputation* has more of conjecture in it; its source is hearsay. It is possible for a man to have a fair *reputation* who has not in reality a good *character*; although men of really good *character* are not likely to have a bad *reputation*." (*Crabb: Eng. Synon.*)

A. *As substantive:*

I. *Ord. Lang.:* The same as II. 1.

II. *Technically:*

1. An impure variety of carbon, prepared from vegetable substances or bones.

(1) *Wood charcoal* consists of wood burned with but little access of air. Billets of wood are built into a heap, which is covered with earth or sand. The heap is fired at openings left near the bottom of the pile, and the gases escape at small openings above. For making fine charcoal, such as that of willow, used in the manufacture of gunpowder, the wood is burned in iron cylinders, or rather retorts, in which a process of destructive distillation removes the volatile hydrocarbons, pyroligneous acid, &c. By this more perfect means the process is accurately regulated. Charcoal is used in the arts as—a fuel; a polishing powder; a table on which pieces of metal are secured in position to be soldered by the blowpipe; a filtering material; a defecator and decolorizer of solutions and water; an absorbent of gases and aqueous vapours; a non-conducting packing in ice-houses, safes, and refrigerators; an ingredient in gunpowder and fire-works; in the galvanic battery and the electric light.

(2) *Animal charcoal:* Used largely in sugar-refining, and as a disinfectant and filtering medium, is prepared by calcining bones in closed vessels. These are either retorts, similar to those in which coal is distilled for the production of illuminating gas, or they are earthenware pots piled up in kilns and fired. Charges of fifty pounds of bones to a pot will require, say, sixteen hours of firing. The bones are then ground between fluted rollers, the dust removed, and the granulated material used for charging the filters of the sugar-refiner. The material is used for removing colour, feculencies, and fermenting ingredients from the syrup. [BONE-BLACK FURNACE.] (*Knight.*)

çhart'-ĭst, *s.* [Eng. *chart* = charter; suff. *-ist.*] A name given to a political party in this country, whose views were embodied in a document called the *People's Charter.* The chief points were—universal suffrage, vote by ballot, annual parliaments, payment of members, equal electoral divisions, and the abolition of property qualification for members. These principles were set out in a bill prepared in 1838. The party became divided in the following year, the extreme members advocating the employment of force for the attainment of their object. These were known as Physical Force Chartists. They perpetrated great outrages at Birmingham on 15th July, 1839, and at Newport in Monmouth, on 4th November of the same year. Inspired by the proclamation of a republic in France early in 1848, they agreed to assemble on 10th April of that year to the number of 200,000 men, and march in procession to Parliament, to present a petition alleged to be signed by six millions of persons. Under the direction of the first Duke of Wellington, the Bank of England, the Post Office, and other public buildings were in consequence temporarily fortified, whilst troops supported by artillery held the bridges. About 200,000 civilians were sworn in as special constables, among them being Louis Napoleon, afterwards the Emperor Napoleon III. The petition was permitted to be delivered, and was found to have only two millions of signatures, many of them forged. The procession was forbidden, its suppression being facilitated by the suggestive fact that only about 20,000 had actually put in an appearance at the place of rendezvous. The rise of the Chartists was in large measure produced by the distress consequent on the existence of protection, and when free trade was established, with the effect of raising wages and cheapening food, the movement died away. Now one never hears of a Chartist, but it is worth noting that some points of the Charter, and notably household suffrage and vote by ballot, have been accepted by the legislature, and are the law of the land.

". . . like the haggard, *check* at every feather

¶ (1) Crabb thus distinguishes between to *check*, to *curb*, and to *control*:—"To *check* is to throw obstacles in the way to impede the course; to *curb* is to bear down by the direct exercise of force, to prevent from action; to *control* is to direct and turn the course: the actions of men are *checked*; their feelings are *curbed*; their actions or feelings are *controlled*. External means are employed in *checking* or *controlling*; external or internal means are employed in *curbing*: men *check* and *control* others; they *curb* themselves or others: young people ought always to be *checked* whenever they discover a too forward temper in the presence of their superiors or elders; it is necessary to *curb* those who are of an impetuous temper, and to keep youth under *control*, unless they have within themselves the restrictive power of judgment to *curb* their passions and *control* their inordinate appetites."

(2) He thus discriminates between to *check*, to *chide*, to *reprimand*, to *reprove*, and to *rebuke*:—"The idea of expressing one's disapprobation of a person's conduct is common to all these terms. A person is *checked* that he may not continue to do what is offensive; he is *chidden* for what he has done that he may not repeat it: impertinent and forward people require to be *checked*, that they may not become intolerable; thoughtless people are *chidden* when they give hurtful proofs of their carelessness. People are *checked* by actions and looks as well as by words; they are *chidden* by words only: a timid person is easily *checked* . . . the young are perpetually falling into irregularities which require to be *chidden*. To *chide* marks a stronger degree of displeasure than *reprimand*, and *reprimand* than *reprove* or *rebuke* . . . *Chiding* and *reprimanding* are employed for offences against the individual, and in cases where the greatest disparity exists in the station of the parties: a child is *chid* by his parent; a servant is *reprimanded* by his master. *Reproving* and *rebuking* have less to do with the relation or station of the parties than with the nature of the offence; wisdom, age, and experience or a spiritual mission give authority to *reprove* or *rebuke* those whose conduct has violated any law human or divine . . ."

(3) The difference between to *check* and to *stop* is thus stated:—"To *check* is to cause to move slowly; to *stop* is to cause not to move at all: the growth of a plant is *checked* when it does not grow so fast as usual; its growth is *stopped* when it ceases altogether to grow: the water of a river is *stopped* by a dam; the rapidity of its course is *checked* by the intervention of rocks and sands. When applied to persons, to *check* is always contrary to the will of the sufferer; but to *stop* is often a matter of indifference, if not directly serviceable: one is *checked* in his career of success by some untoward event; one is *stopped* on a journey by the meeting of a friend." (*Crabb: Eng. Synon.*)

¶ Crabb thus distinguishes between to *cheer*, to *encourage*, and to *comfort*:—". . . To *cheer* and *comfort* have both regard to the spirits, but the latter differs in degree and manner: to *cheer* expresses more than to *comfort*; the former signifying to produce a lively sentiment, the latter to lessen or remove a painful one: we are *cheered* in the moments of despondency, whether from real or imaginary causes; we are *comforted* in the hour of distress. *Cheering* is mostly effected by the discourse of others; *comforting* is effected by the actions, as well as the words, of others. Nothing tends more to *cheer* the drooping soul than endearing expressions of tenderness from those we love; the most effectual means of *comforting* the poor and afflicted, is by relieving their wants." A. *As substantive:*

1. The curd or caseine of milk, with variable quantities of butter and common salt, pressed into moulds and ripened by keeping. The various kinds of cheese differ chiefly in the mode of manufacture, the amount of fat which they contain, and in the flavour, which is due partly to the food, and partly to the breed of the animal. In this country, cheese is made from the milk of the cow, but on the continent of Europe it is made from goat's milk and ewe's milk, whilst in Arabia it is prepared from the milk of the camel and the mare. There are three kinds of cheese, viz., whole-milk, skim-milk, and cream-cheese. To the first class belong the Stilton, Cheddar, Dunlop, Gloucester, and American, all of which are made from unskimmed milk and contain from 20 to 40 per cent. of fat or cream, and 30 to 50 per cent. of caseine. Skim-milk cheese is poor in fat, containing from 1 to 4 per cent. Cream-cheese contains from 60 to 70 per cent.

Authorities differ as to the dietetic value of cheese, some affirming that it is very indigestible, whilst others assert that it assists digestion. Its digestibility, however, varies with its age, its texture, and its composition, and it is possible that it may produce different effects on different persons. Cream-cheese is more digestible than any other kind of cheese, owing to its containing less caseine.

Cheese is rarely adulterated. To suit the public taste it is frequently coloured with annatto, or some other vegetable colour, and so long as the colouring matter is not injurious, it cannot be considered an adulteration.

1. *History:*

(1) Claims to have been the originators of chemistry have been put in on behalf of the Egyptians and the Chinese, but details are wanting. The blow-pipe was known to the former people [Vol. I., p. 596, col. 2].

(2) *The Greek period:* The first stage in the development of chemistry seems to have been conducted by the Greeks, who gave prominent attention to investigating the properties of plant juices for medicinal purposes. This would now be called pharmacy, though some of the more recondite researches might lay the foundation of organic chemistry.

(3) *The Arabian and Mediæval periods* (those of Alchemy): When the Arabs adopted the Greek word χημεία (*chēmeia*) or its analogue, and prefixed to it their article *al* = the, their

inquiries took a new form, and were mainly those to which the term Alchemy is still applied. Suidas himself had defined χημεία (*chēmeia*) as "the making of silver and gold." The Moors introduced alchemy into Spain about A.D. 1150. For its further history see ALCHEMY.

(4) *The modern period* (that of Chemistry properly so called): As astronomy developed from astrology, so chemistry came forth from alchemy. The transition was gradual, but a considerable part of it was effected in the 15th century, though straggling alchemists flourished till the 18th.

Among the discoveries which have made chemistry what it now is, the following may be mentioned: Boyle, who published his "Sceptical Chemist" in 1669, introduced the use of chemical reagents or tests. In 1674 Mayow, of Oxford, perceived that respiration produced the same effect on atmospheric air as combustion did. In 1756 Dr. Black proved that an aeriform body (carbon dioxide) existed in carbonate of lime, thus distinguishing it from quicklime. About 1765 Mr. Cavendish brought to notice hydrogen gas. On August 1, 1774, Dr. Priestley discovered oxygen, and in the latter year Cavendish made known the constituent elements of water. In 1774 Scheele discovered chlorine, and in 1785 Berthollet pointed out the use which might be made of it in bleaching; the same year also he described the elements of ammonia. In 1797 Vauquelin discovered chromium. In 1803 Dalton introduced his atomic theory. In November, 1807, Sir Humphrey Davy intimated the existence of potassium and sodium. Klaproth during his life, which ended in 1817, analysed nearly 200 minerals. The synthesis of urea by the molecular transformation of ammonium cyanate, by Wohler in 1828, also the discovery of the synthesis of cyanogen and alcohol, &c., showed that organic compounds could be formed without the aid of plants or animals. The discoveries of Wurtz, Berthelot, Kolbe, Baeyer, &c.; the researches of Williamson on ethers, Hoffmann on compound ammonias, Frankland on organic radicals, Kekule on the benzene series, Bunsen's spectroscopic researches, leading to the discovery of the elements casium and rubidium, followed by the discovery of thallium by Crookes, &c., and the synthesis of alizarin and indigo, may be mentioned to give some idea of the rapid progress of chemistry in recent years. (Consult Watts's *Dic. Chem.* and the *Journals* of the English, German, and French Chemical Societies.)

2. *Modern divisions of chemistry:* It is divided into *organic* and *inorganic* chemistry, the former comprising the chemistry of carbons and the compounds derived from them, and the latter dealing with the compounds of the other elements. The supposed distinction between organic and inorganic compounds was broken down by Wöhler in 1828 by his preparation. Another classification is into pure or theoretical, analytical, and applied or practical chemistry. The latter may be subdivided according to the arts or occupations which it is designed to benefit, as *agricultural* chemistry, &c.

3. The quarter or any smaller division of an apple, pear, &c., cut regularly into pieces; the chess or lith of an orange.

II. *Tech.:* The game of chess is of very great antiquity. It was probably invented in China or India, certainly in the East. In India it has been from time immemorial known as *chaturanga, i.e.*, the four *angas*, or members of an army, viz.: elephants, horses, chariots, and foot soldiers. This was by the Persians corrupted into *chatrang*, and by the Arabs into *shatrang.* By them it was introduced into Spain in the eighth century, and from thence it found its way into France, and was known in England before the Norman conquest. From the Arabic *shatrang* came the still further corrupted forms *scacchi, échecs*, and *chess.* In the modern European arrangement the idea of elephants, horses, chariots, and foot soldiers has been abandoned, and, in their places, have been substituted a king, queen, knights, bishops, castles or rooks, and pawns, forming six distinct classes of pieces. [See these words.] The name *rook* is the Hindu *rat'h* = an armed chariot; Pers. *rokh*: the *pawns* are the foot-soldiers, Hindu *peon* = an attendant. The game is played on a board divided into sixty-four squares, coloured alternately black and white. Each player has sixteen pieces, viz., a king, a queen, two bishops, two knights, two castles or rooks, and eight pawns. The manner of moving each piece is regulated by rule, and the object of each player is to checkmate the other. [CHECKMATE.]

chicken-pox, *s.*

Path.: The common name for Varicella, a contagious and infectious disease which in some respects resembles modified small-pox, and is characterised by a specific eruption, which breaks out over the whole body, and runs a definite course in about eight or ten days. The disease appears to be the result of a specific poison which, after a period of latency or incubation, develops into one of more or less feverishness. This lasts for two or three days, when an eruption of pimples appears, at first on the body, then on the face and head, the fever subsiding as the rash appears. These pimples soon fill up with lymph, and become vesicles which in their turn, two or three days later, shrivel up and fall off in the form of crusts or scabs, seldom, however, becoming purulent or pitting as in the eruption of small-pox. Chicken-pox appears to have obtained its name partly from the pulse or pea-like (Fr. *chiche*) character of the rash in the first instance, and partly from the mild nature of the complaint as compared with small-pox. Swine-pox, bastard-pox, hives, horn-pox, pearl or stone-pox, are the names popularly given to this disease, according to the character of the eruption, which varies somewhat in different cases. Adults seldom suffer from chicken-pox.

Bot. & Comm.: The root of the *Cichorium intybus,* Wild Succory or Chicory. The plant is cultivated in various parts of England and Europe and is also raised in California. The roots were formerly used medicinally, possessing properties resembling those of the Dandelion. The root roasted has been employed as a substitute for coffee for more than a century. It is now used extensively as a mixture with genuine coffee, but is regarded as an adulterant, and by the Adulteration Act the seller is bound to acquaint the purchaser

CHICORY.

with the fact that the compound is sold not as genuine coffee, but as a mixture of chicory and coffee. Its presence is easily detected by the microscope, and by the brown colour which is immediately produced when a few grains are thrown into cold water. Chicory root is heated in iron cylinders, which are kept revolving as in the roasting of coffee. In this country about two pounds of lard are added to every hundred-weight of the kiln-dried root during the roasting process. In France butter is used. By this a lustre and colour resembling that of coffee is imparted to it. When roasted the chicory is ground to powder and mixed with the coffee. Chicory contains some saccharine matter, but otherwise does not serve to supply the animal economy with any useful ingredient. Its extensive use sometimes produces diarrhœa. The prepared chicory gives a deep brown color to water, when an infusion is made, and it is this property which makes it valuable for the adulteration of coffee, giving an artificial appearance of strength. As in the case of many other adulterants, chicory itself is sometimes adulterated, the adulterants being roasted pulse, damaged wheat, parsnips, carrots, logwood and mahogany dust, burnt sugar, dog-biscuit, and even baked livers of horses and bullocks. Venetian red and ruddle are used to color it. (*Ure, &c.*)

¶ Crabb thus distinguishes between *chief, principal,* and *main*: "*Chief* respects order and rank; *principal* has regard to importance and respectability; *main* to degree or quantity. We speak of a *chief* clerk, a commander in *chief*; the *chief* person in a city; but the *principal* people in a city; the *principal* circumstances in a narrative, and the *main* object." It contains the upper third of the field, and is determined by one line, either drawn straight, or *crenellé,* or indented. Sometimes one chief is borne upon another, which is called surmounting, and is usually expressed by a line drawn across the uppermost part of the chief. When a chief is charged with anything it is said to be *on chief,* but when a thing is borne on the top of the escutcheon it is said to be borne *in chief.*

Among savages the *chief* of every tribe is a despotic prince within his own district. Factions and parties in a state, . . . must have their *leaders,* . . . Robbers have their *chieftains,* who plan and direct everything, having an unlimited power over the band. The *heads* of families were, in the primitive ages, the *chiefs,* who in conjunction regulated the affairs of state. *Chiefs* ought to have superiority of birth combined with talents for ruling; *leaders* and *chieftains* require a bold and enterprising spirit; *heads* should have talents for directing." (*Crabb: Eng. Synon.*)

In the third, or severest type, vesicles rise on the swollen skin, which become sores, discharging irritating matter. The disease affects young people more frequently than adults, and girls oftener than boys. A cure of mild chilblains may sometimes be effected if they be rubbed with snow or ice-water, and finally immersed in it till the pain and itching cease. This should be repeated several times a day, the affected parts being dried and enclosed in leather casings.

If, however, anything atrocious be done with obvious malice by a child, it may be held that *malitia supplet ætatem*, malice supplies [the want of] age. The age at which a child can be sworn as a witness depends on the education it has received and its apparent comprehension of the nature and obligation of an oath.

child-crowing, *s.*

Med.: The name popularly given to an affection of the larynx, of which the most remarkable feature is a peculiar crowing or hissing sound caused by the breath being drawn with more or less violence into the windpipe in the effort to remove some impediment, which is usually of a spasmodic character, existing in that organ. The disease is peculiar to childhood, and is caused by reflected irritation from worms, teething, and other disorders upon the muscles of the larynx, through the recurrent laryngeal and pneumogastric nerves. The symptoms, which are those of impending suffocation, are most alarming and must be relieved instantly, but the attack is seldom fatal. Child-crowing, technically called *laryngismus stridulus* (q.v.), is also known as false-croup, from its resemblance in some respects to that disease. True croup is, however, quite a distinct affection, and a much more formidable one.

"There is a sort of bastard croup. . . . Spasmodic croup is the most common of its names. . . . My late colleague, Dr. Ley, in a volume upon this curious disorder . . . adopts from Dr. Mason Good the appellation of Laryngismus stridulus. A. *As substantive:*

I. *Ordinary Language:*

1. *Literally:*

(1) The state of being moderately cold; chilliness.

(2) A sudden sensation of coolness, generally accompanied with shivering; a sudden check to the circulation of heat.

II. *Technically:*

1. *Painting:* A dulness or dimness in a painting; also called *blooming.*

2. *Iron Manuf.:* A piece of iron introduced into a mould so as to rapidly cool the surface of molten iron which comes in contact therewith. Cast-iron, like steel, is hardened by rapid cooling, and softened by the prolongation of the cooling process. The extreme in the former direction gives chilled iron the hardness of hardened steel; the extreme in the direction of softness is obtained by prolonging the heat, abstracting the carbon from the cast-iron, reducing it to a nearly pure crystalline iron. [Malleable iron.]

The chilled cast-iron ploughshare has a hard under-surface, and the top wears away, leaving a comparatively thin edge of hardened metal. This resembles the natural provision in the teeth of rabbits, squirrels, and other rodents, whereby the enamel remains in advance of the softer portion of the tooth, keeping a sharp edge. (*Knight.*)

B. *As adjective:*

I. *Literally:*

1. *Subjec.:* Having a sensation of coolness; somewhat cold.

2. *Objec.:* Moderately cold; causing a sensation of coolness, generally accompanied with shivering; chilly.

¶ Crabb thus distinguishes between *chill* and *cold*: "*Chill* expresses less than *cold*, that is to say, it expresses a degree of cold. The weather is often *chilly* in summer; but it is *cold* in winter. We speak of taking the *chill* off water when the *cold* is in part removed; and of a *chill* running through the frame when the *cold* begins to penetrate the frame that is in a state of warmth." They are pure white, except the muzzle, which is black, and the horns, which are tipped with black. The white colour on the body, however, is artificially produced, the owner causing all spotted calves to be killed. They are now generally believed to be the descendants of the mountain bull or Urus which were wild in Gaul at the time of Cæsar's invasion, and the stock whence our larger cattle have been derived. Some writers have thought them descended from ordinary cattle which have become wild, and others have made them a distinct species, *Bos Scoticus.* Professor W. Boyd Dawkins considers them the last surviving representatives of the gigantic Urus of the Pleistocene period, reduced in size and modified in every respect by their small range and their contact with man. 1. *Music:*

(1) A number of bells attuned to each other in diatonic succession. A peal consists of three or more bells in harmonic succession, which may be rung successively or simultaneously, but will not admit of a tune being played upon them. Thus a set embracing the eight notes of the common scale will constitute a chime, while a set upon the first, third, fifth, and eighth of the scale would be a peal. The smallest number of bells that can be said to constitute a chime is five, but the number may be increased indefinitely. The usual number is at least nine, which number embraces the eight notes of the natural scale, with the addition of a flat seventh. Apparatus for ringing chimes is said to have been first made at Alost, in East Flanders (Belgium), in 1487. Pottheff, the chime-player of Amsterdam, in the latter part of the 18th century, played pianoforte music with facility. Each key required a force equal to two pounds' weight. (*Knight.*)

4. A tube of glass placed over the flame of a lamp to increase the draught, improve the combustion, and protect the flame.

II. *Hist.:* Down to the thirteenth century, the people seem to have been generally destitute of chimneys. The open hole for the emission of smoke is referred to in Herodotus, viii. 137:—"Now it happened that the sun was shining down the chimney into the room where they were; . . . the boy, who had a knife in his hand, made a mark with it round the sunshine on the floor of the room." In the Middle Ages people made fires in their house in a hole or pit in the centre of the floor, under an opening formed in the roof; and when the family lay down for the night—for it can hardly be said that they went to bed—the hole was closed by a cover of wood. The laws of the feudal ages (*couvre-feu* of the French; curfew-bell of the English) ordered that such fires should be extinguished at a certain time in the evening. William I. introduced this law into England in 1068, and fixed the *ignitegium* at seven in the evening. The law was abolished by Henry I. in 1100. Chimneys, in the modern sense, were not common before the reign of Elizabeth. Thus Harrison, in his *Description of England* (ed. Furnivall), i. 338, says: "Now have we manie chimnies; and yet our tenderlings complaine of rheumes, catarrhs, and poses [colds in the head]; then had we none but reredosses [open hearths]; and our heads did never ake." A tax, called Chimney-money (q.v.), was imposed on each hearth or stove in a house in the reign of Charles II., and was abolished in the reign of William and Mary.

The following are the names of the various parts of the chimney: The opening into the room is the fireplace. The floor of the fireplace is the hearth. The paved portion in front of the hearth is the slab. At the back of the fireplace is the fire-back. The flaring sides of the fireplace are the covings. The vertical sides of the opening, a part of the wall of the apartment, are the jambs. The chimney-piece is the ornamental dressing around the jambs and mantel. The entablature resting on the latter is the mantel. The mantel-shelf, or mantel-piece, rests thereupon. The whole hollow space from the fireplace to the top of the wall is the funnel, or chimney-hood. The contracting portion of the funnel is the gathering. The narrowest part is the throat. The throat is closed (at times) by a damper. Above this is the flue. The wall above the mantel against the flue is the breast. The chimney above the roof is the shaft. This, in England, is usually surmounted by a chimney-pot, and that frequently by a hood, vane, or cowl. A cluster of chimneys is a stack. A chimney-board closes the fireplace in summer. A ciper-tunnel is a false chimney placed on a house as an ornament or to balance things. (*Knight.*)

Chinese architecture. The architecture of China had its rise from Indian art introduced with the worship of Buddha. But diversities of treatment soon appeared, and instead of the Indian dagoba arose a tower-like construction of many storeys, growing gradually smaller towards the top, and with each stage distinctly marked, and covered with many-coloured curved roofs, to which bells were attached. These edifices were, for the most part, octagonal, and were constructed for religious purposes. Chinese structures have nothing durable about them, wood forming an essential element in their construction. They are more remarkable for their elegance and slender proportions than for size. The roofs are especially characteristic, the most striking peculiarities being that they are always curved, and have figures on them in high relief, as well as at the corners, from which hang bells, and that they are decorated with fantastic embellishments, such as dragons, &c. The Chinese do not possess the art of arching large spaces, and consequently numerous columns are introduced for the support of the ceilings and roofs; these are of wood, sometimes carved, but always painted. II. *Technically:*

1. *Hist.:* The rise of chivalry has been placed by some as late as the crusades, but at that time it was in an advanced stage of development. From the 9th to the 12th century, a "miles," that is, one bearing a designation which in classical times meant simply a soldier, and in the mediæval period a knight, was one who held land or fee from a superior, and was in consequence bound to render him military service. When a young man who was heir to these responsibilities came of age enough to formally pledge himself to discharge them honourably, a ceremony of investiture took place. The Church, as was natural and right, sought to add solemnity to the interesting event, and made the investiture of a youthful knight an imposing religious ceremony, holding up, moreover, before him a high moral and religious ideal to which he was exhorted to aspire. Mercy to vanquished foes and purity in the youthful knight's relations to women were earnestly pressed upon him; and there was undoubtedly more of both than if the Christian Church had not interfered. Yet withal the ages of chivalry were marked to a frightful extent by cruelty and impurity. Whilst the Church counselled and poets celebrated the religious and moral elevation of the true knight, that individual himself manifested little of either; his principles and his practice were wonderfully different. Chivalry declined and fell with the feudal system, of which it was a normal growth. The institution of the military orders, the Knights Templars, the Knights of St. John, and the Teutonic Knights, was an interesting development of chivalry. To a certain extent also it has a place in the present, its ceremonies being retained in the creation of modern knights, though some of them are all but meaningless. But whatever in the days of its vigour it effected in making society braver, more compassionate, and more pure, created for it a title to gratitude which should never pass away.

* 2. *Law:* A tenure of land by knight's service; also called tenancy *in chief*, or *in capite.* [CHIEF, B., II. 1.]

"*Servitium militare*, of the French *chevalier:* a tenure of land by knight's service. There is no land but is holden mediately or immediately of the crown, by some service or other; and therefore are all our freeholds, that are to us and our heirs, called *feuda*, fees, as proceeding from the benefit of the king. As the king gave to the nobles large possessions for this or that rent and service, so they parcelled out their lands, so received for rents and services, as they thought good: and those services are by Littleton divided into *chivalry* and socage. The one is martial and military; the other clownish and rustick. *Chivalry*, therefore, is a tenure of service, whereby the tenant is bound to perform some noble or military office unto his lord: and is of two sorts; either regal, that is, such as may hold only the king; or such as may also hold of a common person as well as of the king. That which may hold only of the king, is properly called sergeantry; and is again divided into grand or petit, *i.e.* great or small. *Chivalry* that may hold of a common person, as well as of the king, is called scutagium."—*Cowel.*

chlör-ą-çĕt'-Ĭc, *a.* [From Eng., &c. *chlor(ine),* and *acetic* (q.v.).] Derived from chlorine and acetic acid.

chloracetic acid, *s.*

Chemistry :

Monochloracetic acid, $CH_2Cl.COOH$, is obtained by the action of chlorine on boiling glacial acetic acid. It boils at 186°, and solidifies at 64°. Soluble in water, and is gradually decomposed when the aqueous solution is boiled. Heated with KHO it is converted into potassium glycollate, $KC_2H_3O_3$.

Dichloracetic acid, $CHCl_2COOH$, is formed by the action of chlorine on monochloracetic acid. It boils at 105°.

Trichloracetic acid, CCl_3COOH, is obtained by the action of excess of chlorine on glacial acetic acid in direct sunlight, or by oxidation of chloral hydrate with chromic acid or with nitric acid ; also synthetically by the action of Cl and H_2O on C_2Cl_4 carbon dichloride. It is a colourless acid deliquescent substance. Nascent hydrogen reduces it to acetic acid. Boiled with excess of ammonia it yields ammonia carbonate and chloroform. By PCl_5 it is converted into trichloracetyl chloride, $CCl_3{\cdot}CO{\cdot}Cl$.

Bot.: An extensive genus of terrestrial orchids, exclusively found in the southern districts of South America. Their roots are coarse, fascicled, glutinous fibres. The leaves are all radical. The scape is clothed with thin herbaceous sheaths. The flowers grow in spikes or racemes in the manner of the Green Orchis, are greenish, whitish, or yellow, occasionally marked by deep brown specks. Some thirty or forty species are known, none of which are in cultivation. (*Treas. of Bot.*) It is thought in Chili that *Chlorœa disoides* promotes the flow of milk.

chlör'-ąl, *s.* [From Eng., &c. *chlor(ine) ; -al.*]

Chem.: C_2HCl_3O or $CCl_3.CO{\cdot}H$= trichloraldehyde. Chloral is a colourless, odorous, oily liquid, boiling at 94°. It is soluble in water, alcohol, and ether. Sp. gr., 1·502. It is obtained by passing chlorine gas through absolute alcohol. By the action of caustic potash it is decomposed into chloroform and formate of potassium. It changes on keeping into a solid white modification, reconverted into a liquid by heat. With water it forms a crystalline compound called hydrate of chloral, $CCl_3.HC(OH)_2$. It is used to adulterate beer.

chloral hydrate, *s.*

Pharm. (*Chloral Hydras*)*:* A white crystalline substance, forming a neutral aqueous solution if free from HCl. Its solution in chloroform, when shaken up with sulphuric acid, remains colourless if no oily impurities are present ; 100 grains of hydrate of chloral dissolved in an ounce of distilled water and mixed with thirty grains of slaked lime should yield, when carefully distilled, not less than seventy grains of chloroform. Chloral is used in medicine in the form of a syrup. It produces sleep, but only acts as an anodyne during sleep, the pain returning as soon as the patient wakes. The habitual use of this drug is followed by profound melancholy and enfeeblement of will, and muscular lassitude and suicidal insanity. It was discovered by Dr. O. Liebreich.

chlör'-ąl-ĭzm, *s.* [Eng. *chloral ; -ism.*]

The carbonate of calcium is removed by filtration, and on evaporating the solution the potassium chlorate separates out in colourless transparent anhydrous six-sided plates ; water dissolves only 3·3 parts of the salt at 0°C. It is insoluble in alcohol. When heated, potassium chlorate is decomposed thus $2KClO_3=KClO_4+KCl+O_2$; on increasing the heat the potassium perchlorate is decomposed—$KClO_4 = KCl + 2O_2$. [Chloric acid.]

chloric acid, *s.*

Chem.: $HClO_3$. A monobasic acid obtained by decomposing barium chlorate, $Ba(ClO_3)_2$, by dilute sulphuric acid, and decanting the clear liquid. It oxidises organic matter rapidly. When boiled it gives off O_2 and Cl_2, and perchloric acid is formed. It forms

It is used in the manufacture of fireworks, percussion caps, and lucifer matches. Chlorates when heated on charcoal deflagrate. When heated strongly they give off oxygen and are converted into chlorides which give a white precipitate with argentic nitrate. Heated with strong H_2SO_4 they give off Cl_2O_4 with explosive violence. Hydrochloric acid liberates euchlorine, an explosive mixture of chlorine and chlorine tetroxide; it is a powerful oxidising agent, used to destroy organic matter.

1. *Chem.:* C_2H_5Cl, or $CH_3.CH_2Cl$. Ethyl chloride, Chlorethane, also called Hydrochloric ether, a monatomic haloid ether formed by substitution of an atom of chlorine for an atom of hydrogen in the hydrocarbon ethane by the direct action of chlorine. It also can be prepared by the union of hydrochloric acid with ethene, C_2H_4, and by distilling at a gentle heat alcohol saturated with dry hydrochloric acid gas. It is a thin, colourless, volatile liquid, boiling at 12·5°. By the action of hot aqueous caustic potash, it is resolved into ethyl alcohol and potassium chloride; with alcoholic potash it forms ethylic ether, $C_2H_5{}^{\cdot}O.C_2H_5$. Heated with soda-lime, it yields ethene, C_2H_4.

chlör´-īde, *s.* [Eng. *chlor(ic)*, and suff. *-ide* (q.v.).]

Chem.: A compound of chlorine with an element, or radical. Hydrogen chloride, H.Cl = Hydrochloric acid = Chlorhydric acid = Muriatic acid. Hydrochloric acid is a colourless gas. It is very soluble in water; 450 volumes dissolve at 15°. It fumes strongly in damp air. It is formed by the action of diffused daylight on a mixture of H and Cl, also by the action of strong sulphuric acid on sodium chloride; it can be collected over mercury; it is condensed into a colourless liquid by a pressure of 40 atmospheres at 10° C. Sp. gr., 1·27. Its solution in water (commonly called hydrochloric acid) is easily obtained by distilling common salt NaCl with sulphuric acid. Muriatic acid is an impure solution of HCl, containing iron, arsenic, organic matter, and sulphuric acid. It is obtained in large quantities in the preparation of sodium carbonate. The hydrogen in hydrochloric acid can be replaced by metals, forming metallic chlorides (see the different metals). Soluble chlorides are detected by their giving a white precipitate with silver nitrate which is insoluble in nitric acid but soluble in ammonia. Chlorides heated with strong H_2SO_4 and MnO_2 give off chlorine.

Chloride of antimony solution:

Pharm.: Antimonii Chloridi Liquor. A heavy yellowish-red liquid. Sp. gr., 1·47. It consists of terchloride of antimony, $SbCl_3$, dissolved in hydrochloric acid; on the addition of water it gives a precipitate of oxychloride, SbOCl; this, treated with sodium carbonate, is converted into the oxide Sb_2O_3. [Antimony.] Chloride of antimony is a powerful caustic and escharotic, and is applied to cancerous growths and poisonous wounds. The oxide of antimony, mixed with twice its weight of calcium phosphate, is a substitute for "James's powder." It is given when the diaphoretic and slightly alterative effects of antimony are required in a mild form.

An oily explosive liquid, sp. gr. 1·65, obtained by the action of excess of chlorine on ammonium chloride solution; also by suspending a piece of ammonium chloride in a solution of hypochlorous acid, $NH_4Cl + 3HClO = HCl + NCl_3 + 3H_2O$. This dangerous substance is decomposed violently by gentle heat, or by contact with fat, &c. By some chemists it is thought to contain hydrogen. It is ammonia NH_3 in which the H is replaced by Cl.

Chloride of sodium:

1. *Chem.:* NaCl, sodium chloride or common salt. [Sodium.]

2. *Pharm.: Sodii Chloridum.* It occurs in transparent cubes or in small white grains. It is soluble in three parts of cold water, and its solubility increases very slightly with rise of temperature; it is partly precipitated by HCl. It is nearly insoluble in alcohol, and fuses at 776°, and at higher temperatures volatilises. It is a necessary article of food, and occurs in the blood and other animal fluids; a deficiency causes disease. Chloride of sodium in large doses acts as an emetic, purgative, and anthelmintic; in milder doses it is a slight stimulant and alterative. Externally it is applied as a stimulant and rubefacient. Sponging with salt water is good for rheumatism and joint affections.

chlör-ĭn-ā´-tion, *s.* [Eng. *chlorin(e); -ation.*] A process for the extraction of gold by exposure of the auriferous material to chlorine gas. First introduced by Plattner. The following conditions are necessary:—(1) The gold must be in a metallic state. (2) There must be no other substance in the charge which would combine with free chlorine. (3) The chlorine must have no impurities which would dissolve other metals or bases. (4) No reaction must be induced which would cause precipitation of the gold before the termination of the process. The process with quartz and free gold does not involve roasting, but the latter process is necessary with ores containing sulphurets and arseniurets. In the chlorination process, the ore is sifted into a wooden vat lined with pitch, and having a false bottom, beneath which the gas is admitted. The top is luted on and the gas admitted; when the gas begins to escape at a hole of observation in the lid, it is the signal that the air is ejected and the hole is then closed. The gas is continually passed into the mass for say eighteen hours, according to the coarseness of the gold; the cover is removed and water introduced, and the solution drawn off into the precipitation vat. The gold is precipitated by sulphate of iron, the supernatant liquor decanted. The sediment is a brown powder which is filtered upon paper dried in an iron or porcelain vessel, smelted to a metallic regulus in clay crucibles, a little borax, salt, and nitrate of potash being used as fluxes. 1. *Chem.:* A monatomic element. Symbol Cl. Atomic weight, 35·5. Discovered by Scheele in 1774. It was thought by Berthollet to contain oxygen, and was called by him *oxymuriatic acid.* It was found to be an element by Davy in 1810. Chlorine is a yellow-green incombustible gas. It has a powerful irritating smell, and attacks violently the mucous membrane and the lungs. It is very soluble in water, acts strongly on metals, and is best collected by displacement. Sp. gr., 2·47. At the pressure of five atmospheres it is condensed into a heavy yellow liquid. It is obtained by heating common salt, sodium chloride, with sulphuric acid and black oxide of manganese. It combines with hydrogen to form hydrochloric acid, with an explosion in direct sunlight or when a light is applied to a mixture of the two gases, but slowly in diffused daylight. A solution of it in water is gradually converted in the sunlight into HCl with liberation of oxygen. A lighted candle burns in Cl with a smoky flame. Phosphorus, antimony, arsenic, and turpentine take fire in chlorine. Chlorine destroys animal and vegetable matter; and forms addition and substitution compounds with organic compounds; an aqueous solution of it has powerful bleaching properties. It is also a powerful disinfectant. It occurs in nature in the form of metallic chlorides. Three oxides of chlorine are known, Cl_2O; Cl_2O_3; Cl_2O_4.

It dissolves caoutchouc, resins, fats, alkaloids, &c. It should not be exposed to the light, as it may decompose, hydrochloric acid and chlorine being set free.

2. *Pharm.:* Chloroform is used in medicine, dissolved in alcohol, under the name of chloric ether, as a stimulant. Chloroform taken internally acts as a narcotic, sedative, and antispasmodic, and is given in cases of asthma, colic, and cholera, also for neuralgia. *Linimentum Chloroformi*, equal parts of chloroform and camphor linament, is used externally to allay pain and irritation in neuralgia and itching.

3. *Surgery & Midwifery:* The vapour of chloroform, when inhaled for some time, produces a temporary insensibility to pain. Inhaled in small doses it produces pleasurable inebriation, followed by drowsiness; in larger doses it causes loss of voluntary motion, suspension of mental faculties, with slight contraction of the muscles and rigidity of the limbs; then if the inhalation is continued a complete relaxation of the voluntary muscles takes place, but if carried too far it causes dangerous symptoms of apnœa or of syncope, and the patient must be restored by artificial respiration. Chloroform should not be administered to persons suffering from cerebral disease or organic cardiac affection. Dr. Simpson, of Edinburgh, in 1847, began to employ the vapour as a means of producing anæsthesia or insensibility, partial or complete, in certain surgical operations and painful diseases, as well as in ordinary obstetric practice.

A. *As substantive:*

1. The nut of the cacao-tree. [Cacao.]

2. A paste or cake made from the roasted kernels of the *Theobroma cacao.*

¶ The roasted and crushed seeds of the cacao-nut tree are ground between two horizontal millstones, which are kept at a temperature of about 200° F., by means of a steam-jacket. The nibs pass down from the hopper into the shoe, which is shaken by a damsel on the spindle of the runner so as to discharge the nibs into the eye which leads them to the space between the stones. The heat and friction liberates the oil, which is one third of the weight, and the cacao issues as a paste from the spout and is conducted to a second and similar mill where the stones are similarly heated but are closer set, so as to still farther reduce the paste. It is discharged from the second grinding in a liquid condition and is collected in a pan, where it hardens into a cake. To enable it to form an emulsion with water, it receives additional substances. Sugar, honey, molasses, gum, starch, flour, rice, and arrow-root are adapted for this purpose. Spices and flavouring extracts are added for some markets.

A. *As substantive:*

Med.: One of two or three diseases more or less akin to each other. They are—

1. *British Cholera:* A severe form of diarrhœa, somewhat resembling but quite distinct from Asiatic Cholera. [2.] It occurs usually during the summer months, and is due for the most part to deleterious food or drink taken into the body exciting the purging, vomiting, and cramps which characterise the complaint. Children often succumb to this disease; adults rarely.

2. *Asiatic* or *Malignant Cholera:* A malignant disease due to a specific poison which, when received into the human body through the air, water, or in some other way, gives rise to the most alarming symptoms and very frequently proves fatal to life. An attack of cholera is generally marked by three stages, though these often succeed each other so rapidly as not to be easily defined. There is first a premonitory diarrhœa stage, in which the stools soon become very copious, watery, and rice-coloured, there is also occasional vomiting, with severe cramps in the abdomen and legs, and great muscular weakness. This condition is succeeded, and often within a remarkably short period, by the second stage, which is one of collapse, and is called the algid or cold stage. This is characterised by intense prostration, suppression of urine, great thirst, feebleness of circulation and respiration, with coldness and blueness of the skin, iciness of the breath, and loss of voice. Should death not take place at this the most fatal period, the sufferer will then pass into the third or reaction stage of the disease. This, though very frequently marked by a high state of fever, with a tendency to congestion of internal organs, as the brain, lungs, kidneys, &c., is a much more hopeful stage than that which has preceded it, and the chances of recovery are very much increased. Asiatic Cholera is so called from having had its home, so to speak, in the East, and more especially in India for centuries, though there is little doubt that under other names it had been previously epidemic in the United States and Great Britain. The nature of the disease was not fully recognised until the outbreak of 1831 occurred. Similar epidemics in 1848-49, in 1853-54, and in 1865-66 have increased our knowledge of the mode of propagation of choleraic poison, and strict attention to the laws of sanitation will do much if not all to prevent it finding that habitat which appears necessary for its development into epidemic activity.

¶ *Spasmodic Cholera* is another name for Asiatic Cholera. [No. 2.]

"The malady known by the name of *spasmodic cholera* . . . hadbeen known in India from the remotest periods, and had at times committed fearful ravages. Its effects, however, were in general restricted to particular seasons and localities, and were not so extensively diffused as to attract notice or excite alarm. In the middle of 1817, however, the disease assumed a new form, and became a widely spread and fatal epidemic. It made its first appearance in the Eastern districts of Bengal, in May and June of that year, and after extending itself gradually along the north bank of the Ganges, through Tirhut to Ghazipur, it crossed the river, and passing through Rewa, fell with peculiar virulence upon the centre division of the grand army, in the first week of November . . . During the week of its greatest malignity it was ascertained that seven hundred and sixty-four fighting men and eight thousand followers perished."—*Mill: Hist. India*, Continuation by H. H. Wilson, viii. 253.

A. *As substantive:*

Chem.: $C_{26}H_{44}O = C_{26}H_{43}(OH)$. A monatomic aromatic alcohol, which occurs in small quantities in the bile, brain, and nerves. It forms the chief part of biliary calculi, obtained by boiling these in alcohol. It crystallizes in colourless plates, which melt at 137° and sublime at 200°. It exists naturally in most animal liquids in a state of solution; also in many animal solids, as in the blood, the bile, the meconium, the brain and spinal cord. As an abnormal product it occurs in the crystalline form in the bile, biliary calculi, various dropsical effusions, the contents of cysts, pus, old tubercles, malignant tumours, the excrements, and expectoration of phthisis. In the vegetable kingdom it occurs in peas, beans, almonds, many seeds, &c. Cholesterine is insoluble in water and solution of potash, even when boiling; but soluble in ether and boiling alcohol, crystallizing on cooling. It is most easily procured from gall-stones (of which it is the chief constituent), by finely powdering them, then boiling the powder in alcohol, and filtering when hot, when the cholesterine will deposit on cooling in pearly scales. The crystals thus obtained are usually thicker than the natural plates. It is very sparingly soluble in cold alcohol and not at all in water.

"Knaves abroad,
Who having by their own importunate suit

But they must blab." *Shakesp.: Othello,* iv. 1.

¶ *To choose:* By or of choice.

"Be a lord *to choose.*"—*Farquhar: Twin Rivals,* ii. 2.

¶ (1) Crabb thus distinguishes between *to choose* and *to prefer:* "To *choose* is to *prefer* as the genus to the species; we always *choose* in *preferring,* but we do not always *prefer* in *choosing.* To *choose* is to take one thing instead of another; to *prefer* is to take one thing before or rather than another. We sometimes *choose* from the bare necessity of *choosing;* but we never *prefer* without making a positive and voluntary *choice.* When we choose from a specific motive, the acts of *choosing* and *preferring* differ in the nature of the motive. The former is absolute, the latter relative. We *choose* a thing for what it is, or what we esteem it to be of itself; we *prefer* a thing for what it has, or what we suppose it has, superior to another. . . . We calculate and pause in *choosing;* we decide in *preferring;* the judgment determines in making the *choice;* the will determines in giving the *preference.* . . . A wise prince is careful in the *choice* of his ministers; but a weak prince has mostly favourites whom he *prefers.*"

(2) He thus discriminates between *to choose, to pick,* and *to select:* "*Choose* is as in the former case the generic; the others are specific terms: *pick* and *select* are expressly different modes of *choosing.* We always *choose* when we *pick* and *select;* but we do not always *pick* and *select* when we *choose.* To *choose* may be applied to two or more things; to *pick* and *select* can be used only for several things. . . . To *choose* does not always spring from any particular design or preference; to *pick* and *select* signify to *choose* with care."

(3) The difference between *to choose* and *to elect* is thus stated: "Both these terms are employed in regard to persons appointed to an office; the former in a general, the latter in a particular sense. *Choosing* is either the act of one man or of many; *election* is always that of a number; it is performed by the concurrence of many voices. A prince *chooses* his ministers; the constituents *elect* their members of parliament. A person is *chosen* to serve the office of sheriff; he is *elected* by the corporation to be mayor. *Choosing* is an act of authority; it binds the person *chosen; election* is a voluntary act; the *elected* has the power of refusal. People are obliged to serve in some offices when they are *chosen,* although they would gladly be exempt. The circumstance of being *elected* is an honour after which they eagerly aspire . . ." (*Crabb: Eng. Synon.*)

II. *Technically:*

1. *Gr. Drama:* The chorus was probably originally a company of dancers in a ring. In later times a choric performance implied the singing or musical recitation of a poetical composition, accompanied by appropriate dancing and gesticulation. As choral performances were especially cultivated in all the Dorian states, and particularly in Sparta, the Dorian dialect came to be regarded as the appropriate dialect for such compositions. Arion, a contemporary of Periander, first gave the chorus a regular choral form. It consisted of about fifty men or youths, who danced round the altar of Dionysus. From these cyclic choruses was developed the Attic

tragedy. [TRAGEDY.] The exact number of the chorus in the times of the earlier tragic poets is uncertain; from Sophocles onwards the regular number was fifteen. It was arranged in a quadrangular form, and entered the theatre by a passage to the right of the spectators in three lines. To guide them in their evolutions lines were marked upon the boards of the orchestra. The functions of the chorus in the Greek tragedy were very important. It acted the part (1) of a dispassionate and right-minded spectator, inculcating the lessons of morality and resignation to the will of heaven, as taught in the piece being acted; and (2) of a guide to explain events supposed to happen in the intervals between the acts and scenes. In comedy the number of the chorus was twenty-four, consisting half of males and half of females.

Christ, *s.* [Lat. *Christus*; Gr. χριστός (*christos*) = anointed, and χρίω (*chriō*) = to anoint.]

The Anointed One: The appellation given to Our Lord as His official title, and corresponding to the Hebrew Messiah (q.v.).

"And he saith unto them, But whom say ye that I am? And Peter answereth and saith unto him, Thou art the *Christ*."—*Mark* viii. 29.

¶ Used in the plural to signify persons who would pretend to be the true Christ.

"For false *Christs* and false prophets shall rise,..."—*Mark* xiii. 22.

¶ The two names, *Jesus Christ*, are not analogous to a modern Christian name and surname; in reality the great Being so designated had but one personal appellation—Jesus: Christ being superadded at a later period to designate his office, function, or mission. Jesus, Gr. Ἰησοῦς (*Iēsous*), is the equivalent of the Heb. יְהוֹשֻׁעַ or יֵהוֹשֻׁעַ (*Yehoshua*), *i.e.*, Joshua, meaning Jehovah-Saviour, Deliverer, or Helper. [Jesus.] It was borne by the military leader in the wars of Canaan (Joshua i.—xxiv., actually called Jesus in the authorised version of Acts vii. 45, and Heb. iv. 8), by Jesus surnamed Justus, a fellow-labourer with Paul (Col. iv. 11), and by about a dozen of other persons figuring in the pages of Josephus; in fact the name seems to have been not uncommon among the Jews. But we learn from St. Matthew that in this particular case the appellation was given previous to birth by Divine authority. "... thou shalt call his name *Jesus*, for he shall save his people from their sins." The year [Christian era], the month, and the day [Christmas], when the child Jesus was born are matters of more or less uncertainty, not having been recorded with precision at the time. The salient features, however, of the life thus begun were narrated by four evangelists [Evangelists], who are believed by the immense majority of Christians to have written with infallible accuracy and trustworthiness under the guidance or inspiration of the Spirit of God. [Inspiration.]

The circumstances heralding or attendant upon the birth of John, afterwards the Baptist, and the miraculous conception and nativity of Jesus, the last-named event at Bethlehem, are told at length by St. Luke (Luke i. ii.); while St. Matthew relates the visit of the Magi, the slaughter of the infants at Bethlehem, and the flight of the holy family to Egypt (Mat. ii.).

These occurrences took place while Augustus, the first Roman Emperor, was upon the throne (Luke ii. 1). Thirty years later, under the reign of Tiberius, John, now grown to full manhood, appeared in the wilderness of Judea, as an ascetic and preacher of repentance, the necessity of which he urged on the ground that the kingdom of heaven was at hand. Those who confessed their sins he baptized in the river Jordan, and thus a new religious community arose, separated to a certain extent from the ordinary professors of Judaism (Mat. iii. 1—10, Luke iii. 1—14). Some suspected that he might be the "Christ" or "Messiah" of ancient prophecy, but he disclaimed the honour, indicating that he was but the forerunner of another who should baptize with the Holy Ghost and with fire, that is as with fire. (Mat. iii. 11, 12; Luke iii. 16; John i. 20—23.)

Meanwhile Jesus, now about thirty years of age, had come forth from the obscurity in which he had hitherto resided at Nazareth. (Luke ii. 51, iii. 23.) Having sought and obtained baptism from John, with Divine recognition as the Son of God, and having overcome temptation in the wilderness, He without further delay addressed Himself to His life-work in the world. (Matt. iii. 13—17, iv. 1—11; Luke iii. 21, 22, iv. 1—14.) He claimed to be the Messiah spoken of by holy men of old (Dan. ix. 25, 26, &c.), nay more, to be, in one sense, the subordinate (John x. 29), and in another the equal of His Heavenly Father (v. 30). His ministry, whilst not ignoring repentance (Luke xiii. 3—5), was one chiefly of faith (John iii. 14—19) and love (John xiii. 34; Matt. v. 43—46). Twelve apostles (Matt. x. 1—6), and afterwards seventy other disciples, were chosen to aid him in his ministry (Luke x. 1, &c.), the former baptizing converts as they arose (John iv. 2). John the Baptist saw his own reputation pale away under the greater glory of his Divine successor, but never allowed this to evoke jealousy within his breast (Matt. iii. 11; Luke iii. 15; John i. 15, 27, 29, iii. 28—31), and when his faithfulness in reproving sin, even in high places, led to his suffering a martyr's death (Matt. xiv. 3—12), his baptized followers, either at once or gradually, transferred themselves to Jesus (John i. 35—37; Acts xix. 1—5).

The latter holy teacher thus left alone, continued His ministry, it is believed, for about three years in all, chiefly at Capernaum and other places near the Lake of Galilee (Matt. iv. 13; Luke vii. 1), as well as in other places of that province (Luke vii. 11, &c.; Matt. xvi. 13), in Perea beyond Jordan (Matt. xix. 1; Mark x. 1; Luke viii. 37), in Samaria (John iv. 1—42), beyond the Holy Land in Phenicia (Mark vii. 24), and, chiefly on occasions of the great festivals, at Jerusalem, which necessitated His visiting other parts of Judea (Matt. xx. 29; John ii. 23, vii. 1, 2, 10). He supported His claims to be the Messiah by miracles of knowledge, *i.e.*, prophecies (Matt. xx. 19, &c.; Luke xix. 41—44) and miracles of power, such as healing the sick (Matt. ix. 35, &c.), nay, even raising the dead (Mark v. 22—43; Luke viii. 41—56; John xi. 1—44).

The chief priests and other dignitaries who held sway in the Jewish synagogues, were stirred up nearly to madness by jealousy of His success, and eagerly accepted the offer of an unworthy apostle, Judas Iscariot (*i.e.*, apparently of Kerioth in Judea) to betray his Lord. A manufactured charge of blasphemy led to the condemnation of Jesus by His deadly foe, the high priest, but as the power of life and death now rested not with the Jewish authorities, but with the Roman governor, Pontius Pilate, a charge of disaffection to the imperial government was manufactured, as it was felt that the heathen Roman would not attach any weight to the alleged blasphemy. The procurator had discernment to see clearly that what he was required to do was to sanction a judicial murder, and for some time refused to become partner in the Jewish ruler's guilt. But as the cry, "Crucify him," "crucify him," continued to rise from the multitude, he resolved to avoid unpopularity at the expense of moral principle, and gave sentence that it should be as the Jews required. The crucifixion therefore took place (Matt. xxvii.; Mark xv.; Luke xxiii.; John xix.). Friday was the day when the nefarious deed was done, and three days later, or early on Sunday morning, news was brought to the Apostles, and the Church generally, by certain women of their company who had visited the sepulchre, that a resurrection had taken place (Matt. xxviii.; Mark xvi.; Luke xxiv.; John xx., xxi.). At a subsequent interview with their risen Lord He gave the Apostles and their successors a commission to make disciples of all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost (Matt. xxviii. 19, &c.); and about forty days after the crucifixion He led them out as far as Bethany and lifted up His hands and blessed them. "And it came to pass, while he blessed them, he was parted from them, and carried up into heaven" (Luke xxiv. 50, 51.). He had predicted His cruel death, His resurrection on the third day (Matt. xx. 19), and His ascension (John xx. 17), and had intimated that at a future period He would again return to the earth in glory (Matt. xxvi. 64, &c.) For the leading dates connected with the life of Christ, see Christian Era; for more details regarding the doctrines, and for the subsequent history of the Christian Church, see Christianity.

Trench draws attention to the fact that we never in the New Testament find the word applied to the followers of Jesus, except by their adversaries, and that it was not introduced till the preaching of Paul to the Gentiles of Antioch, and other causes, showed that the disciples of the Crucified One indicated by their devout Master aimed at making their religion that of the entire world. The application of the name Christian showed that the faith so designated was perceived to be not a Jewish sect, but a religion freed from nationality or from locality, that it might better discharge its mission to the world. Christian architecture, *s.* The introduction of Christianity naturally had its effect on the style of architecture adopted for religious buildings. The Roman Early Christian style appeared first in basilicas and circular churches. The former were, doubtless, originally built on the model of the Roman basilicas [BASILICAS], but the requirements of the new religion soon necessitated various modifications in the original plan. The Christian basilicas were constructed generally with three aisles : the central one broader than the others, the left or north being reserved for males, and the right or south for females. Sometimes we find five aisles. The building terminated in a semicircular apse. The decorations consisted of paintings and mosaics, used mainly in the apse. The pillars were generally of the Corinthian order. [CORINTHIAN.] Symbols were largely introduced. These were the cross, the monogram of Christ, a lamb or a dove, as typifying the Holy Spirit, and a fish, used as a symbol of Christ from the letters of the Greek word ἰχθύς (*ichthus*)=a fish, forming the initials of the titles of our Lord, Ἰησοῦς Χριστός Θεοῦ υἱὸς σωτήρ (*Iesous Christos, Theou huios, sōtēr*) = Jesus Christ, the Son of God, the Saviour. The roofing was of beams with flat panelling, frequently gilt. The altar stood at the east end in front of the apse. The space round the altar was railed off and called the sanctuary. Adjoining the entrance was generally a narrow space called the Narthex. [NARTHEX.] In the middle of a portico in front of the building was a bowl for washing the hands. [CANTHARUS.] A crypt was constructed under the altar for the reception of the bones of the patron-saint. The most magnificent specimen of Byzantine architecture is the Church of St. Sophia at Constantinople, built originally by Constantine, and rebuilt after its destruction by fire, by Justinian in the sixth century. [BYZANTINE.] Russian church architecture was at first a deterioration of Byzantine, modified in the fifteenth century, by the introduction of bulb-shaped domes, adopted from the Tartars. The Gothic, or Pointed style, the most familiar to us in religious architecture, is distinguished by the pointed arch, formed of two segments of a circle meeting in a point. [GOTHIC.] The Perpendicular and Flamboyant styles are deteriorations of the Gothic [FLAMBOYANT, PERPENDICULAR], deriving their names from the form of the tracery, of the windows, and ornaments. The Classic styles of architecture have been comparatively rarely adopted in church architecture. The Cathedral of St. Paul, which by its dome recalls St. Peter's at Rome, is an example of the Renaissance, or revived Roman style. In plan, English churches generally form a Latin cross, consisting of a nave, transepts, and chancel—(see these words) — their direction being almost invariably east and west. In a few isolated instances, such as St. Sepulchre's, at Cambridge, the plan is circular.

Christian courts, *s. pl. Law :* The same as ECCLESIASTICAL COURTS.

Christian Endeavor.

A non-sectarian religious organization founded in February, 1881, by the Rev. Francis E. Clark, D.D., at Portland, Maine, with an original membership of less than fifty. In 1896 the movement had extended to nearly every foreign country and missionary land, was endorsed by thirty-two Christian denominations, with 43,579 societies organized and a total membership of about 2,600,000. The local branches comprise those of the Young People, Junior, Intermediate, Senior, Mothers, Parents, &c., collectively termed, in their respective countries, the United Society of Christian Endeavor. An international organization, known as the World's Union of Christian Endeavor, has been recently organized, with a view to holding a general convention every three years, the first convention being held in Washington, D. C., in July, 1896. Rev. Dr. Clark, the founder of this remarkably successful enterprise, is President of the United Society in this country, also of the World's Union.

Christian era, *s. Chron. :* The era or epoch introduced by the birth of our Lord. It was calculated back about the year 532, by a monk, Dionysius Exiguus, the latter word, meaning little, being assumed either because his stature was diminu-

tive or because he modestly believed his mental powers small, which they were not. It is thought that he fixed the advent too late by four years, and that consequently Jesus was born, if the contradiction in terms can be permitted, in B.C. 4. Mr. J. W. Bosanquet considers that it was in B.C. 3. On these views the year 1882 of the Christian era is really 1886 or 1885. The Christian era is sometimes called the Dionysian era.

1. Christendom; the professors of the Christian religion.

2. The Christian religion; the doctrines and precepts taught by Christ.

¶ To take a comprehensive view of Christianity, attention should be given to (1) its doctrines, (2) its government and discipline, and (3) its history from the time that it was introduced into the world until now.

(1) *The Doctrines of Christianity:* Though the professors of Christianity have separated into many sects, as have the Mohammedans, the Brahmanists, and others, yet all but a small minority are really at one with respect to certain great fundamental doctrines. Christians believe in a Supreme Being—the one living and true God. The immense majority hold that it is not inconsistent with monotheism to accept the tenet that in the Divine Unity there is a Trinity, the Father, the Son, and the Holy Spirit, to all of whom worship of the highest kind can be paid. Jesus Christ is identified by them with the second person of the Godhead, and is held to be at once God and Man. As God He existed from eternal ages, and was not first brought into being when born at Bethlehem. They consider that He was miraculously conceived by the Holy Ghost, and that His mother remained the Virgin Mary after having brought Him into the world. The reason why He came to this earth is held to have been that He had been commissioned by His Eternal Father to undertake a mission of mercy to the earth. Another tenet of their faith represents man as having been created innocent, but to have fallen, and now to be guilty and in need of a Saviour. Christ is believed to have been that Divine Saviour. His life on earth is regarded as having been perfect, so that He constitutes the exemplar for all mankind. His death is held to have been an atonement for sins not His own, and to have been so important that to it all Jewish ceremonies and symbols and all Messianic prophecy, as with a finger, pointed. Faith in His Divine mission and work, and specially on the efficacy of His death, are insisted on to put sinners in possession of the benefits purchased by their Redeemer's death. The historic facts of His resurrection and ascension are pointed to as evidences of the sanction and acceptance of His work by His Heavenly Father, and implicit trust is expressed in His coming again agreeably to His promise to earth, and in His ultimately becoming the Judge of the world. At the final assize it is believed that those whose good deeds show that they have believed in Him, shall be rewarded by eternal felicity, whilst everlasting misery shall be in store for those who have been faithless and wicked. The acceptance of this creed by man in his fallen state, is held to be impossible without Divine assistance, and it is considered that the Holy Ghost, if solicited, will give the requisite spiritual power to produce faith in the most unbelieving heart. The Scriptures of the Old and New Testaments are regarded as possessing inspiration in a sense in which no other book has it, and as being, therefore, in the highest degree fitted to enlighten inquiring minds as to religious duty.

(2) *The government and discipline of Christianity:* [For these see Church Government.]

(3) *The history of Christianity:* [For this see Church History.]

¶ Christianity is part of the law of England, though certain statutes in its support, now regarded as persecuting, have either been allowed to fall into desuetude, or have been formally annulled. Similar laws, making offences against Christianity punishable existed in some of the Colonies, but no such statutes can exist in the United States.

A. *As substantive:*

1. The festival of the Nativity of Christ, observed by the Christian Church yearly on the 25th December.

¶ Augustine considered the fast of Good Friday, and the festivals, Easter, Ascension, and Whitsuntide, as the only holy days which had an Apostolic origin and the sanction of a general council. Christmas he deemed to be of later origin and lesser authority. When the first efforts were made to fix the period of the year when the advent took place, there were, as we learn from Clement of Alexandria, advocates for the 20th May, and for the 20th or 21st April. The Oriental Christians generally were of opinion that both the birth and baptism of Jesus took place on the 6th of January. Julian I., bishop of Rome from A.D. 337—352, contended for the 25th December, a view to which the Eastern Church ultimately came round, while the Church of the West adopted from their brethren in the East the view that the baptism was on the 6th of January. When the festival was at length placed in December, it afforded a substitute to the various nations who had observed a festival of rejoicing that the shortest day of the year had passed, besides spanning over the great interval between Whitsuntide of one year and Good Friday of the next. Coming to the Roman Christian converts in lieu of the saturnalia, to which they had been accustomed while yet they were heathens, its purity became sullied almost at the first by revelry which had crept into it from this source. Similarly the Yule log, the mistletoe, &c., among ourselves, are relics of an older faith.

chromatic aberration, *s.*

Optics: (See extract).

"In the refracting telescopes . . . the different refrangibility of the different coloured rays presents an obstacle to the extension of their power beyond very moderate limits. The focus of a lens being shorter as its refractive index is greater, it follows, that one and the same lens refracts violet rays to a focus nearer to its surface than red. . . . If the paper be held in the focus for mean rays, or between the vertices of the red and violet cones, these will then form a distinct image, being collected in a point: but the extreme, and all the other intermediate rays, will be diffused over circles of sensible magnitude, and form coloured borders, rendering the image indistinct and hazy. This deviation of the several coloured rays from one focus is called *chromatic aberration*."—*Encyclopædia Metropolitana; Light.*

chromic acid, *s.*

Chem.: Chromium trioxide, CrO_3+H_2O, a substance obtained from chromium, much used by dyers and calico-printers for dyeing orange or red colours. It may be prepared by adding gradually from 120 to 180 parts, by volume, of pure concentrated sulphuric acid to 100 parts of a cold saturated solution of bichromate of potash. The crystals of the trioxide separate as the solution cools. The mother liquor should be poured off, and the crystals dried upon a tile; they may be purified by recrystallization from solution in water. With excess of sulphuric acid, chromic acid is a valuable reagent for dissolving the intercellular substance of plants; it is also much used in organic chemistry as a powerful oxidizing agent. Chromic acid is readily decomposed by organic matter, as dust, &c., and must therefore be preserved in a well-stoppered bottle. Its aqueous solution, which should be of a pale-yellow colour, is used for hardening and preserving nervous and muscular tissues, &c. It should be prepared when required. Chromic acid, H_2CrO_4, only exists in solution. It dyes wool and silk yellow, but will not dye cotton. Chromic acid boiled in wine dyes wool a clear brown colour, if no colouring matter, acted upon by chlorine acid, has been added to the wine.

chrō'-mĭ-ŭm, *s.* [Gr. χρῶμα (*chrōma*) = colour.]

Min.: A metallic tetrad element discovered by Vauquelin in 1797; symbol, Cr.; atomic weight, 52·2; sp. gr., 6. The chief ore of this metal is chrome-iron, $FeOCr_2O_3$, found in the Shetland Islands, and a lead chromate $PbCrO_4$. The metal is obtained by the action of sodium vapour on red-hot chromium trichloride. It forms hard grey cubic crystals, infusible, insoluble in concentrated acids. Chromium forms with oxygen the following oxides:—CrO, Cr_2O_3, Cr_3O_4, CrO_3. All compounds of chromium are prepared from the *chromates.* Chrome-iron ore is fused with carbonate of potassium and chalk, and the fused mass is treated with water, and a soluble yellow chromate of potassium, K_2CrO_4, is obtained; it crystallises in yellow rhombic anhydrous crystals, isomorphous with potassium sulphate; it dissolves in 2 parts of water at 16°; its solution is of a strong yellow colour, even when dilute. *Chromium dichromate,* or bichromate of potassium, $K_2Cr_2O_7$, is obtained by adding sulphuric acid to the chromate; it crystallises red triclinic crystals; it is used for making pigments. It dissolves in 10 parts of water at 16°. Lead chromate, $PbCrO_4$, a fine yellow precipitate, is obtained by adding a soluble lead salt to a solution of potassium chromate; it is called *chrome-yellow.* By heating it with saltpetre it is converted into a basic red chromate, called *orange-chrome* or *chrome-orange.* Chromium trioxide CrO_3 is formed by adding excess of H_2SO_4 to potassium chromate; it forms soluble red needle crystals, which are reduced by organic matter to *sesquioxide of chromium.* By heating to redness potassium dichromate it is converted into neutral chromate and *sesquioxide of chromium,* Cr_2O_3, which is a beautiful green powder, giving a green colour to glass and porcelain; it is nearly insoluble in acids. The pigment used to produce a pink colour on earthenware is made by heating to redness a mixture of thirty parts of peroxide of tin, ten of chalk, and one of potassium chromate; the product is powdered, and washed with hydrochloric acid. The hydrated oxide can be obtained as a green precipitate by adding ammonia to one of its salts. Chromic chloride Cr_2Cl_6 and chromic sulphate $Cr_2(SO_4)_3$ are obtained by dissolving the hydrated oxide in the acid. The salts of chromium sesquioxide exist in green and in violet-red modifications. Potassium dichromate is easily reduced by boiling it with hydrochloric acid and alcohol to chromium sesquichloride and chloride potassium. When sulphuric acid is used, chrome-alum, a double sulphate of chromium and potassium, is obtained, which has a deep violet tint. *Chromium monoxide* chromous oxide, CrO, absorbs oxygen rapidly; it is only known in the form of hydrate $Cr(OH)_2$. *Chromium dichloride,* $CrCl_2$, is a powerful deoxidizer. Chromium salts are easily detected by giving in both the inner and outer blowpipe-flame green beads with borax, by forming a yellow soluble salt when fused with an alkali, which is converted into a green solution by reducing agents. Ammonia gives a green precipitate with the sesqui-salts. Potash and soda hydrates give a precipitate of $Cr_2(OH)_6$, soluble in excess, reprecipitated on boiling. Ammonium sulphide precipitates the hydrated green sesquioxide of chromium $Cr_2(OH)_6$. Chromium can be detected in the presence of the other metals of this group, by fusing the precipitate with KNO_3, or platinum-foil, treating the fused mass with water, filtering, acidifying with acetic acid, and adding plumbic acetate, which precipitates yellow plumbic chromate.

chromo-lithograph, *s.* A lithograph printed in colours.

chromo-lithograph, *v.* To produce by chromo-lithography.

chromo-lithographer, *s.* A printer of chromo-lithographs.

chromo-lithography, *s.* The art of printing chromo-lithographs.

(1) *Hist.:* Colour-printing was first used in Europe in illuminating missals and making playing-cards, but it was not successful till it was combined with lithography, invented between A.D. 1796 and 1800 by Alois Senefelder of Prague.

(2) *Present Process:* An outline-drawing is first traced, then various stones are taken, one for each colour, to which the drawing is transferred. Then the artist puts in the colours, with soap, of the tints required. Next the slab is put upon the press and damped, after which the oil colour is applied with a leathern roller; the parts which contain no drawing, being wet, resist the ink, while the drawing itself, being oily, repels the water while retaining the colour.

chromo-type, *s.*

1. *Printing:* A sheet printed in colours. The modes are various, but the usual plan is to prepare a block for each colour, or a form for each colour, and to place the paper upon each in succession, the exact place being preserved at each impression by means of register pins or a similar device. [CHROMATIC PRINTING; CHROMO-LITHOGRAPHY.]

2. A photographic picture produced in the natural colours. This was long sought by Niepce de St. Victor, and he announced his success even with yellow, but no way has been discovered of fixing these heliochromic pictures. (*Knight.*)

A substance is prepared by heating gelatine and water with glycerine, and then adding any insoluble white powder to make it firm. It is poured while hot into a shallow tin, and it sets on cooling into a firm mass. It is used as follows: The letter, &c., is written on paper, and a solution of aniline dye is used instead of ink. This is then pressed on the slightly damped surface of the chromograph, to which the writing is transferred, and from it many copies of the original can be obtained. Common forms of chromographs have been formed by using glue and treacle, &c.

II. *Scripture Canon (Pl.):* A name applied to two books of the Canonical Old Testament, which immediately follow 1 and 2 Kings. In the Hebrew Bible they form but a single composition, entitled דִּבְרֵי הַיָּמִים (*Dibre Hayamim*) = words of days, *i.e.*, diaries or journals. The Septuagint translators were the first to divide the one volume into two, which they called Παραλειπομένων πρῶτον (*Paraleipomenōn prōton*), and Παραλειπομένων δεύτερον (*Paraleipomenōn deuteron*) = the first and the second of things left over, *i.e.*, passed by or omitted by the writers of the books of Samuel and Kings. In the Vulgate, Wycliffe, and the earlier printed versions, they are termed 1 and 2 Paralipomenon (q.v.). Jerome called the undivided book *Chronicon*, and the Vulgate *Chronica* or *Chronicorum liber* [CHRONICON], from the former of which two appellations we derive the name Chronicles. To a certain extent the Chronicles are supplementary to the books of Samuel and Kings, but in part they also travel over the same ground, the books of Kings, however, regarding events from the prophetic standpoint, whilst the Chronicles do so from the Levitical point of view. The traditionary opinion, both among Jews and Christians, regards Ezra as having been the author or compiler of the books of Chronicles. If so, then a later hand must have added ch. iii. 19—24, where the descendants of Zerubbabel are enumerated apparently to the third generation. If, on the contrary, that passage was penned by the writer of the other parts of the book, then the composition of the volume itself must be brought down to B.C. 330, if not to 300—nay, there have been advocates for even a lower date, viz., 270 or 260. At even the earliest of these dates the Jewish commonwealth consisted chiefly of the two tribes of Judah and Benjamin, the ten tribes not having returned from captivity. In the books of Chronicles, consequently, the former kingdom of Israel holds but slight prominence, whilst that of Judah, to which the writer was passionately attached and of which to a certain extent he was the apologist, is treated at length. He shows that Judah was prosperous when it followed Jehovah, and fell into misery and decay whenever it rejected Him as its king.

The writer of the books of Chronicles seems to copy or allude to Genesis, Exodus, Numbers, Joshua, Ruth, 1 and 2 Samuel, 1 and 2 Kings, Ezra, and Nehemiah; between xi. 3—24 of the last-named of these books and 1 Chron. ix. 2—34 there is a striking parallelism.

Some of the numbers in Chronicles differ from those in Kings, possibly from errors of copyists, figures in the very nature of things being much more liable than words to undergo alteration. Where Kings and Chronicles differ in this respect, the numbers in the former books are to be preferred.

1. *Chinese and Japanese Chronology:* In these calculation is made by cycles of sixty years, each year of the cycle separately named.

2. *Hindoo Chronology:*

(1) *Historical:* No system is universal in India or exclusive. Two of the chief are the era of Salivahana (A.D. 77), and that of Vicramaditya (B.C. 57).

(2) *Astronomical:* The Hindoos have four ages [YUGA]. We are now in the Kali Yuga, beginning about 3094 B.C.

3. *Egyptian Chronology:*

(1) *Historical:* Julius Africanus and Eusebius have preserved some fragments of a work by Manetho, an Egyptian priest, who lived in the time of Ptolemy Lagus, in the 3rd century B.C. In these fragments the successive rulers of Egypt, from the very first to nearly the time of Alexander the Great in the 4th

century B.C., are arranged in thirty or thirty-one dynasties. Increasing importance has been given to his work, as it has been found that one after another of his statements, once unsupported, have been confirmed by the hieroglyphics of the monuments. A long period is, of course, requisite for so many dynasties. Lane, Stuart Poole, and others largely reduce this by making certain of the first seventeen dynasties contemporaneous, whilst Bunsen, Lepsius, and their followers make them successive, and contend for a lengthened chronology.

(2) *Astronomical:* The Egyptians, moreover, calculated by a tropical cycle of 1,500, and a Sothic cycle of 1,460 Julian years. [CYCLE.]

4. *Greek Chronology:* In the time of Herodotus, and subsequently in that of Thucydides, the Greeks had no chronology spanning wide intervals of time. It was not till B.C. 194 that Eratosthenes, the "father" of Greek chronology, began to count by Olympiads, the first of which was dated from what we now should call B.C. 776. He was followed by Apollodorus, B.C. 115, Censorinus A.D. 238, &c. There were other Greek methods of computation than by Olympiads; thus the era of the Seleucidæ was B.C. 324.

5. *Roman Chronology:* The method of Roman reckoning was by the consulships, which, of course, could give no indication of time unless their order was carefully preserved, and even then was clumsy. A much simpler and better plan was by calculating years from the building of the city. This Varro, whom the moderns follow, placed in what would now be called B.C. 753, while Cato preferred 752. It does not materially diminish the value of this date that Rome would seem to have come into existence earlier than that year. It is enough for chronology that the date to be reckoned from is a fixed one.

6. *Jewish Chronology:* Up till the 15th century the Jews followed the era of the Seleucidæ [4]. Since then they have dated from the creation of the world, which they fix 3760 years and three months before the commencement of the Christian era.

7. *Muhammadan Chronology:* Dates are counted from the Hegira, *i.e.*, the time of Muhammad's flight from Mecca to Medina, 16th or 15th July, A.D. 622.

8. *Christian Chronology:* Since the 6th century dates have begun to be reckoned from the birth of our Lord [CHRISTIAN ERA], though the system did not become universal in Europe till many centuries subsequently. The chief disadvantage of this method is that it requires a counting backward as well as forward; its advantage is that it evades dating the creation of man and of the earth, though, of course, investigations have been made as to how many years B.C. these events, formerly believed to have occurred almost at the same time, took place. Hales brought together 120 opinions on the subject, the extremes varying by 3,268 years, whilst it has been affirmed that even 300 diverse views on the subject exist. One great reason of the discrepancy is that the Hebrew, the Samaritan, and the Greek Pentateuchs all differ as to certain numbers in Genesis v. and elsewhere, so that Archbishop Ussher, following the Hebrew, makes the creation B.C. 4004, while Hales, preferring the Septuagint Greek, fixes the date at 5,411.

9. *Scientific Chronology:* Wherever the occurrence of an eclipse of the sun or moon has been noted by an ancient or other historian in the annals of any year, which he accurately notes, astronomy will ultimately fix that eclipse with unerring exactitude to the day, hour, minute, and second. The only uncertainty at present is that the value of certain tables, called Hansen's, by which the moon's motion is computed, has excited differences of opinion. Geology has proved finally and irreversibly that the world was in existence many millions of years before man came upon the scene, and that the two events must not be confounded by chronologists. Occurrences marking the several stages in the earth's past history, it has hitherto dated by geological periods, or subdivisions of them, not by historic time. It is only now beginning cautiously to feel its way to date in years a few events of the Post-Pliocene, or at furthest, of the Newer Pliocene periods. [GLACIAL PERIOD.] The first appearance of man (a very recent geological event) it carries back further than history has as yet ventured to do. [ANTIQUITY OF MAN, PALÆOLITHIC, &c.]

chrŏn-ŏm'-ĕ-tĕr, *s.* [Fr. *chronomètre*, from Gr. χρόνος (*chronos*) = time, and μέτρον (*metron*) = a measure.]

1. *Horol.:* An instrument for the exact measurement of time. This general meaning would include clocks, watches of all kinds, clepsydras, and some other devices, such as hour-glasses and the graduated candles of the famous King Alfred. The term is, however, applied in a restricted sense to those having adjustments and compensations for the fluctuations of temperature. Chronometers are known as ship's and pocket. The rating of chronometers is usually conducted at government observatories. The instruments are sent from the different watchmakers and received at stated periods. They remain the greater part of a year, their rates being noted daily by two persons. The best receive prizes and are purchased for the navy; others receive certificates of excellence; others are unrewarded. On their arrival in January, they are left to the ordinary atmospheric temperature for some months; their rates are taken under these conditions. The apartment is then heated to a tropical temperature, and the rate taken. They are then placed for a certain period in trays over the stove, and the rate taken. They are then placed in a refrigerating chamber cooled by a freezing mixture, and the rate taken under this artificial arctic temperature. Their capacity to stand these variations constitutes their value, and their actual range of exposure may be estimated at 180°—from the + 120° of Aden and Fernando Po to the − 60° of the Arctic regions when frozen in the pack of ice and watching through the long, long night. (*Knight.*)

2. *Music:* An instrument to indicate musical time; a metronome.

"An instrument under the . . . name *chronometer* is also used by musicians for the accurate measurement of time. Two sorts have been invented for different purposes. The first supplies the motion of the conductor, and regularly beats time. . . . The second is used by tuners of instruments to measure the velocity of beats."—*Encyclopædia Metropolitana.*

chronometer-escapement, *s.* An escapement invented by Berthoud, and improved by Harrison, Arnold, Earnshaw, and Dent. It is the most perfect, delicate, and satisfactory in its operation, of all the escapements. It is also kept more carefully, at least in marine chronometers, as the gimbal-joint hanging enables it to maintain a constant position relatively to the horizon, and it is carefully guarded from jars.

chrŏn-ō-mĕt'-rĭc, chrŏn-ō-mĕt'-rĭ-cal, *a.* [Fr. *chronométrique.*] Pertaining to a measurer or the measurement of time; pertaining to, or measured by, a chronometer.

". . . to carry a chain of *chronometrical* measurements round the World."—*Darwin: Voyage Round the World* (ed. 1870), ch. i. 1.

chronometric-governor, *s.* A device by which a time-measurer set to work at a prescribed and equable rate is made to regulate the motion of an engine. Invented by Wood, and improved by Siemen.

chrŏn-ŏm'-ĕt-rў, *s.* [Fr. *chronométrie.*] The art or science of the division and measurement of time. (*Maunder.*)

chrŏn'-ō-scōpe, *s.* [Gr. χρόνος (*chronos*) = time; σκοπέω (*skopeō*) = to see, to examine.]

1. An instrument invented by Prof. Wheatstone in 1840, to ascertain the velocity of projectiles by measuring small intervals of time. Two wire targets are placed, one about twenty yards from the gun, and the second about the same distance farther on. These are connected by a fine insulated wire with the instrument, which is about 400 yards in the rear of the ordnance. The instrument is adjusted on a plan similar to an electro-ballistic machine. When the shot is fired it cuts the wire in the first target, and then in like manner cuts the wire in the second target, the instant each wire is severed being recorded by the instrument. The interval of time occupied by the ball in passing from one target to the other furnishes the data for obtaining the initial velocity of the shot.

2. An instrument to measure the duration of luminous impressions upon the retina. (*Webster.*)

3. A metronome. (*Craig.*)

Mineralogy:

1. A green-coloured orthorhombic mineral of a vitreous lustre, transparent or translucent. Hardness, 6—7; sp. gr., 3·33—3·5. Compos.: Silica, 31·63—44·67; protoxide of iron, 6·0—29·71; protoxide of manganese, 0—1·81; magnesia, 32·40—50·49. It is generally divided into two classes:—(1) *Precious:* Of a pale yellowish-green colour and transparent, so as to be fit for jewelry. This is found in the Levant. (2) *Common:* Dark yellowish-green to olive, or bottle-glass green; common in basalt and lavas, at times in large masses, having a rectangular outline. The *chrysolithus* of Pliny was probably our topaz, and his topaz our chrysolite. It frequently changes colour, becoming brownish or reddish-brown through the oxidation of the iron. Under the action of carbonated waters, the iron is carried off instead of being peroxidized, and also some of the magnesia is removed at the same time; and thus may come serpentine and picrosmine, which often retain the crystalline form of chrysolite.

2. The same as Zircon (q.v.).

3. The same as Topaz (q.v.).

4. A variety of Tourmaline, also called Brazilian Emerald or Peridot of Brazil. It is green and transparent.

5. The same as Apatite (q.v.).

It occurs in a gneissoid rock consisting partly of augite and garnet at Tunaberg in Sweden. (*Dana.*)

Titaniferous chrysolite:

Min.: A massive reddish-brown mineral from the talcose schist of Pfunders, in the Tyrol, having some resemblance to boltonite; sp. gr., 3·25. It contains 3·5 to 5·3 of titanic acid, with 6 per cent. of protoxide of iron.

Ger. *kirche*; Ger. *kirche*; Dut. *kerk*; Dan. *kirke*; Sw. *kyrka*; Icel. *kirkja.* It is believed that the word κυριακή (*kuriakē*) originally passed over from the Greeks to the Goths, the first Teutonic tribe converted to Christianity. From the Goths it diffused itself over the other Teutonic tribes, ultimately reaching the Saxons, and through them becoming introduced into the English tongue. Walafrid Strabo, who wrote about A.D. 840, gave this explanation of the origin of the word "kyrch." (*Trench: On the Study of Words*, pp. 67, 68.)]

¶ **1.** *Church of England:*

(1) *Hist.:* The foregoing designation is used in two senses; *first*, a general one signifying the Church regarded as continuous, which, from the first triumph of Christianity till now, has been that of the English people, and *secondly*, in a more specific sense, the Protestant Church now established in England as distinguished from the Church of Rome.

As early as the 2nd century, Tertullian says that those parts of Britain which were inaccessible to the Romans had become subject to Christ. They received the gospel from Gaul and not from Rome. This Celtic Church was driven from E. and S. England by the Saxons.

These invaders were gradually converted by Augustin and his companions sent from Rome for the purpose, and by the early part of the 7th century, the seven kingdoms of the heptarchy were all nominally Christian. In England, as elsewhere, the centuries between the 7th and the 13th were marked by the growth and ultimate domination of the Papacy, and in 1213, King John, to the disgust of his subjects, surrendered his crown to the Roman legate. But the submission was never complete, and certain Parliamentary measures in the 14th century, designed to protect the civil power against the encroachments of the Church, look as if they had been proposed at a much later period. In the same century, Wycliffe on the one hand, and Chaucer and the author of "Piers Plowman" on the other, inflicted heavy blows upon the Church's reputation. Thoroughly alarmed in the 15th century for its supremacy, it became increasingly cruel in its treatment of "heretics," and in the 16th the Reformation came. In 1531, the royal supremacy, which was intended to supersede the papal one, was imposed on the clergy by Henry VIII., and was made use of to produce other changes. In the same year Coverdale's Bible was appointed to be read in churches. In 1549, the first book of Common Prayer was published, and permission given to the clergy to marry. In the reign of Edward VI., A.D. 1547 to 1553, more sweeping measures of reform were carried out under the auspices of foreign rather than English Protestant leaders, but these were completely swept away in the great reaction in favour of Roman Catholicism which arose when Mary came to the throne. There is evidence that in 1553, when Queen Mary began to reign, the Protestants were in a minority, but in 1558, when Queen Elizabeth came to the throne, they had become a majority, the fires of Smithfield and other places having produced an effect the exact opposite of that which they had been intended to accomplish. The work of reformation was resumed under Queen Elizabeth, and in 1563 the thirty-nine articles became, as they still continue to be, the authoritative statement of the Church's creed. Two parties subsequently came into antagonism in the Church: the Puritans, who wished to constitute it on a basis like that of the churches of Geneva and of Scotland; and an Anglican party, who were reluctant to break so completely with the past. A conference, held from 14th to 16th January, 1604, at Hampton Court, between the leaders on each side, failed to effect their reconciliation, and they went their separate ways. In 1611 was published the version of the Bible which is now called the authorised one, that which maintains its place at present, notwithstanding the issue of the revised version. The disputes between the Puritans and the Anglicans continued during the remainder of the reign of Elizabeth, and during those of James I. and Charles I. During the Civil War, which commenced in 1640, it was a great object with the Parliamentary party to obtain assistance from the Scotch, who had preceded them in rebellion by three years, having risen in 1637 against an effort to force upon them a liturgy which they abhorred. An ecclesiastical, as well as a political, union was proposed by the Scotch, who were then, as now, Presbyterian; and in 1644, the Book of Common Prayer was suppressed and the directory of public worship produced by the Westminster Assembly of divines substituted in its room. A reaction against the new arrangements was not long in arising, and with the return of monarchy episcopacy was restored. In 1662, the Act of Uniformity was passed, which compelled about 2,000 clergymen, mostly Presbyterian in sentiment, to resign their livings, and laid the foundation of modern Nonconformity. The Act is still in force. The effort of James II., in violation of his coronation oath, to undo the reformation in the English Church, injured not it but himself, and the attempt has never been renewed on the part of any subsequent sovereign. The evangelistic zeal of Whitfield, Wesley, and various other clergymen, in the 18th century, awoke the Church to new life, which did not pass away even when the followers of the two great preachers just named ceased to belong to the English Church. The evangelical party, still the most numerous in the Establishment, is, in large measure, the fruit of 18th century revival effort. In the 19th, the movement has been in other directions. With 1833, just after the passing of the first Reform Bill, the first of a series of "Tracts for the Times" came forth, and ninety, in all, were issued within the next eight years. The ritualistic party, at a later date, carried on the work which the tractarians had begun. In 1860 the *Essays and Reviews*, and in 1862 a work by Bishop Colenso on the Pentateuch, gave prominence to the opposite pole of thought, being what theologians call strongly rationalistic. Church Congresses, bringing the representatives of these three parties face to face, soften their antagonisms, and fear of common danger renders them more united than they otherwise would be.

(2) *In the United States:* The first Church of England services in the American Colonies took place at Jamestown, Virginia, in 1606, the holy communion being celebrated by the Rev. Robert Hunt, under an awning suspended between the trees. The Protestant Episcopal Church continued to prevail in Virginia during the colonial period, and was also established in the Carolinas and Georgia, while in Maryland the freedom of religion proclaimed by the Roman Catholic settlers became an intolerance of Catholicism when the English Church gained the ruling power. In the Middle Colonies the Church was never established, and in New England it was bitterly opposed, but made its way to some extent in that stronghold of Puritanism, particularly in Connecticut. After the Revolution the church in America was organized under bishops consecrated in England, though for a long time its growth was very slow. Within the present century, however, the growth has been rapid, its progress becoming so marked in the larger states that the original assignment of a bishop to each state was found to be inadequate, and new dioceses were formed within the limits of the states, New York, for instance, now having seven. The church, though still low in members as compared with the other denominations, is in an active and promising condition. In England and Wales its adherents number more than 13,000,000.

3. *Church of Ireland, Irish Church:* A popular name sometimes given, prior to 1871, to what was not an independent denomination, but was an integral part of the United Church of England and Ireland. It constituted the Established Church of the two countries. When on 1st January, 1871, the Act of Parliament, disestablishing and disendowing the portion of the United Church which was in Ireland, took effect, those affected by the measure, rejecting the name proposed by the Government for the new organization, adopted that of the Irish Church or the Church of Ireland.

4. *Church of Scotland:*

(1) *Hist.:* The original Scottish Church seems to have been that of the Culdees, then in mediæval times the Roman Catholic Church was, to a certain extent, the national church in Scotland, not merely as having within its pale at least by profession all the people, but as maintaining its independence of its powerful southern neighbour. The church resisted the claims to supremacy over it put forth at one time by the Archbishop of York, at another by the Archbishop of Canterbury; and, in 1176, in self-defence cast itself into the arms of the Roman Pontiff. When the 16th century opened, the royal power in Scotland was weak and was jealous of, and in conflict with, a very powerful nobility. When the Reformation struggle began, the Crown remained adherent to the old faith, whilst the nobility tended to adopt the new. From the war of independence, Scotland had considered it good policy to guard against any aggression on the part of England by a close alliance with France, and when the Reformation began there were actually French troops in Scotland. On these the Crown rested to resist the religious movement which had been begun, but the Protestant "Lords of the Congregation," who had taken up arms to defend their cause, applied for aid to Queen Elizabeth, who sent troops to aid them in expelling the French. By a treaty signed on the 7th July, 1560, it was stipulated that both the French and the English troops should withdraw from Scotland. On the 24th August, of the same year, the Scottish Parliament abolished the papal jurisdiction, prohibited the celebration of the mass, and rescinded all the laws made in favour of Roman Catholicism. The reformers adopted what is now called Presbyterian Church government, though certain superintendents were appointed, with the sanction of John Knox, the great Scottish reformer, whose offices after a time were swept away. [Church Government, Presbyterianism.] The first General Assembly was held on 20th December, 1560. When the victory over the Church of Rome was complete, the alliance between the nobility and the Protestant preachers which had effected the triumph, showed symptoms of dissolving, and a large section of the former viewed with distrust, and even active hostility, what they regarded as the too democratic measures which Knox aimed at carrying out. But one inestimable boon was gained ere they parted, the universal establishment of parish schools.

The semi-republican constitution of the Church, which became more marked after the office of superintendent had been swept away, and the second book of discipline published (the latter event in 1578), created jealousy in the minds of regents and of sovereigns, and four or five generations of Stuart kings put forth long and determined efforts to transform Presbyterian into Episcopal government. The project cost the lives and liberties of far more people than the short, sharp Reformation struggle had done, and ended at last in failure. The Revolution settlement of 1690, re-established Presbyterianism, and the General Assembly, which had been interrupted for nearly forty years, began again to sit and has done so annually from that time till now. Prior to the union with England in 1707, an Act of Security was passed, designed to preserve the Scotch national church from being overthrown by southern votes.

In 1712, an Act of Parliament re-introduced patronage which had been swept away. The operation of this enactment was one main cause of three secessions: that of the Secession, preeminently so called, in 1733; the Relief in 1752; and, the greatest of all, that which created the Free Church in 1843.

(2) *Present State:* The Church of Scotland claims about half the people as at least its nominal adherents. Besides the "General Assembly," it had in 1881 sixteen synods, eighty-four presbyteries, 1,500 churches including mission-rooms, and 1,660 ministers and probationers engaged in ministerial work. It has missions in India, Africa, and elsewhere. In 1874 the Patronage Act of 1712 was repealed, and each congregation now elects its own pastor. Its chief rivals in Scotland are the Free Church and the United Presbyterians, the latter resulting from a union of the old Secession and Relief Churches.

¶ Four leading views are at present entertained regarding church government. The first three agree that the rudiments of a scheme of church government are laid down in the New Testament. They differ, however, as to what that scheme is, much the greater number believing it to be *episcopacy*, though one large minority are in favour of *presbyterianism*, and another in favour of *congregationalism.* (See these words.) The fourth view, which has not a large number of advocates, is that no scheme of government was laid down in the New Testament, applicable to all times and places, but that the church has the power of adapting its government to the special circumstances in which it finds itself at any particular time.

The relation in which a church stands to the state has also a practical influence on its government. [Royal supremacy.]

church-history, *s.* The history of any Church, but especially of the Christian Church.

¶ Church history naturally divides itself into four periods: (1) From the advent of Christ to the time of Constantine; (2) From Constantine to Muhammad (usually spelt Mohammed or Mahomet), or by the arrangement of Mosheim and others, to Charlemagne; (3) From Muhammad, or alternatively from Charlemagne to the Reformation; (4) From the Reformation to the present time.

Period 1. (*From the advent of Jesus Christ, B.C.* 4, *to the Conversion to Christianity of the Emperor Constantine, A.D.* 312, *or to his establishment of that faith as the state religion, in or before A.D.* 321): This period may be naturally divided into three sub-periods, (1) The ministry of Jesus; (2) That of His apostles; and (3), That of the Christian fathers after the last of the apostles had died.

The first sub-period has been already treated of. [Christ.] Immediately after the ascension means were taken to fill up by election the vacancy left in the apostolic college by the apostacy and death of Judas (Acts i. 15—26). The descent of the Holy Spirit, which had been promised by Christ (John xiv. 16, 17, and xvi. 7—14, &c.), took place soon afterwards on the day of Pentecost, accompanied by the gift of tongues (Acts ii.), and then the apostles were qualified to go forth and carry into effect the Saviour's last charge to make disciples of all nations. Under the preaching of Peter and the other apostles, thousands were converted and baptised, and such a spirit of love prevailed among the converts that a Christian socialism sprang up, but ere long it produced an Ananias and Sapphira, and we hear of it no more (Acts iv. 32—37, v. 1—11).

The same jealousy which had prompted the Jewish rulers to seek the death of our Lord, led to the persecution of His followers, and Stephen, stoned to death for alleged blasphemy, was the first of the great army of Christian martyrs. A scattering of the Christians took place, which resulted in the founding of other churches, the chief of which was at Antioch in Syria, where the disciples of Jesus for the first time received the name of Christians (Acts xi. 26.) [Christian.]

Previous to this, Peter, moved by a vision, had begun to preach to the Gentiles (Acts xi. 1—18), and not long afterwards Saul of Tarsus, once a bitter persecutor of the Christians but now a convert, was sent out as colleague to Barnabas, on a missionary journey chiefly through Asia Minor, and ultimately became the splendidly successful apostle of the Gentiles (Acts xiii. 2, &c.). No complete coalescence ever took place between the Jewish and the Gentile elements in the early church. The Jews, with a few honourable exceptions, imbued with caste pride, attempted to impose a Judaic yoke on their Gentile brethren, and not ultimately succeeding, many of them in the second century withdrew from the church catholic, and formed the two sects of the Nazarenes and the Ebionites, the former of which retained, while the latter rejected, belief in the divinity of Christ. Whilst Jerusalem stood the unconverted Jews lost no opportunity of persecuting Christianity, but their influence was to a large extent swept away by the partial destruction of Jerusalem by Titus in 70 A.D., and its total destruction after the revolt of Barchochab in the second century. Before the first of these events had taken place, persecution on the part of the heathen Romans had begun, and it continued at intervals during the whole of the first period. The Roman persecutions are generally called ten; but if only those which were universal be reckoned, they were fewer than that number, while if those which were local be taken also into account, they were more. After the last and severest of these—called Diocletian's persecution, though its real instigator was his son-in-law Galerius—a convert of high rank, Constantine, was obtained, who became emperor in A.D. 312, and in 321 or earlier established Christianity as the State religion.

Period 2. (*From the Conversion of Constantine or his establishment of Christianity as the state religion, to the rise of Muhammad*): Whilst all along there had been a general agreement as to Christian doctrine, the several tenets had not been exactly defined, but when controversy regarding any one of them arose, it was for the first time precisely stated. The question whether our Lord was equal with the Father, and truly and absolutely Divine, or whether, as Arius alleged, he was but the first of created beings, was settled by the Council of Nice in 325 in favour of the former view, and though a long struggle between the Trinitarians and the Arians took place, and though sometimes one and sometimes the other party prevailed, the church ultimately settled into belief in the Three-One God. [Arianism.] Other doctrines were settled by the decision of councils. (For these see Council.) The fall of the Western empire in the fifth century almost dissolved the civil power in Italy and elsewhere, but the church was equal to the crisis, and was ultimately enabled to convert the barbarous nations to the Christian faith. In those ages of political confusion and intellectual darkness, whilst as yet society was not fully reconstituted, primitive Christianity became considerably modified, and finally in 780 the worship of images was introduced into the church.

In A.D. 569 or 570 Muhammad was born, and when he sought for religious light, his mind revolted from the Arab and all other idolatry. He was opposed also to the doctrines of the Trinity, and of the Sonship of Christ, against which his religion may be considered as a reaction. [Muhammadanism.] This second period may be made to end with the first preaching of Muhammad, about A.D. 611, or with the Muhammadan era—the Hegira, 15th July, 622, — preferably the former. Or it might be made to terminate with Charlemagne's donation to the Papacy, or with the separation between the Eastern and the Western Churches, for which see *Period* 3.

Period 3. (*From the rise of Muhammadanism to the Reformation under Luther, the latter event dating from A.D.* 1517): Whilst the Greeks, indulging their natural subtilty, took the lead in hair-splitting definitions of doctrine, the imperial Romans were more practically engaged in building up a world-embracing ecclesiastical power in lieu of the secular empire which they had lost, and from the seventh to the thirteenth century the growth of the Papacy was continuous. In 756 Pepin, having defeated Astulphus, King of the Lombards, compelled him to give to the church and the republic the exarchate of Ravenna and the Pentapolis. In 774 Charlemagne confirmed this cession and enlarged the territory given, thus laying the foundation of the Pope's temporal power. [Papacy.] In the eighth century a schism took place between the Patriarchs of Constantinople and Rome, and the separation which still exists between the Eastern and Western Churches began. During the early part of this third period the Eastern Church was sorely trampled down by the Muhammadans, and during the twelfth and thirteenth centuries the Western one came into the conflict in hope of recovering the holy sepulchre, but the Christian success was only temporary. [Crusades. During the fourteenth century the Papacy was declining, during the fifteenth it was attempting to put down evidently imminent revolt by cruel persecution, and in the sixteenth the crisis of its fate came.

Period 4. (*From the commencement of the Reformation under Luther, A.D.* 1517, *to the present time*): For details see Reformation, Protestantism, Roman Catholicism, &c. Suffice it here to say that the Reformation struggle continued in one form or other during nearly the whole of the sixteenth and seventeenth centuries. During the eighteenth all the churches which had been engaged in that arduous struggle slept, till rudely awakened by the French Revolution of 1789, while the nineteenth century has been mainly a reaction against the irreligion of that revolution and the cruelties of the reign of terror. The Bible and the Tract Societies, as well as the great religious missionary organisations, sprang into life while that revolution was working itself out, and have constituted this century to a certain extent an era of missions. [Missions.]

What may be called the extreme right of this party tend strongly towards the Church of Rome, adopting its vestments and its ceremonies, embracing its doctrines, and, in some cases, even entering its pale. The *Low Church* party, the most numerous of the three, agreeing in the main

in doctrine with the Nonconformists, and regarding government as of subordinate importance, more or less fraternise with dissenters, and are defenders with them of Protestantism. A third party, the *Broad Church*, aim at comprehending various forms of belief within the Established Church. The extreme members of this party consider that a Church is not really national unless it comprehend the professors of all beliefs held in the country. As a rule, they are themselves rationalistic in sentiment. This party, the smallest at present of the three, had the powerful advocacy of Dr. Arnold, and more recently of Dean Stanley, and of late has made surprising way.

Entom.: A genus of Homopterous insects, tribe Cicadariæ, sub-tribe Stridulantia, or it may be made a family Cicadidæ. They have three *ocelli* or simple eyes, with the short antennæ in front. The tarsi are three-jointed. The male has a drum or musical apparatus placed in a cavity on each side of the abdomen, and concealed by scale-like plates. A muscle pulls the drum in and again lets it out with the effect of producing a sharp continuous sound. These insects are familiar in the south of Europe, in India, in Bermuda, the West Indies, the warmer parts of America, &c. The Greeks, who considered the cicadas happy in having "voiceless wives," called the animal τέττιξ (*tettix*). The observation that the female cicadas do not emit the sharp continuous sound described is accurate. The Grasshopper and Cicada, though popularly believed the same, are not even of the same order. The former belongs to the Orthoptera, the latter to the Homoptera. The former possesses mandibles, while the latter has a suctorial apparatus instead. The antennæ of the former are very long, and those of the latter very short. The former emits its "voice" by night, the latter in the brightest sunshine. Many other differences between the two exist. *Cicada hæmatodes*, like the rest of the genus a large insect, occurs in the New Forest, in Hampshire. An American species of Cicada, *C. Septendecim*, appears only once in seventeen years, hence it is popularly known as the seventeen-year locust. It is no more akin to the locust than to the grasshopper.

2. *Med.:* The bark procured from the Cinchona-trees.

cinchona bark, *s.*

Pharm.: The barks of several species of Cinchonaceæ are used in medicine, or for the extraction of the alkaloids, quinine, cinchonine, &c., which they contain. The following are the most important:—*Chinchonæ flavæ Cortex*, Yellow Chinchona Bark, which occurs as quills covered with a brown epidermis, mottled with whitish yellow lichens, and also in flat cinnamon-coloured pieces. They break with a fibrous fracture and the escape of a powder. Yellow bark is rich in quinine, and 100 grains should yield not less than two grains of alkaloid. It is derived from *C. Calisaya*, which grows in the peculiar cloudy regions of the Andes.—*C. pallidæ Cortex*, Pale Cinchona Bark, from *C. condaminea*. It occurs always in quills, covered with crustaceous lichens. Its fracture is short and not fibrous. It contains chiefly cinchonine. Two hundred grains of the bark yield about one grain of alkaloid.—*C. rubræ Cortex*, Red Cinchona Bark. The bark of *C. succirubra*. This species appears to thrive in India. It occurs in flattened, rough fibrous, dark-brown red pieces, which are covered with a brown-red epidermis. It breaks with a red fibrous fracture. It contains about equal quantities of cinchonine and quinine, and 100 grains of the powdered bark should yield not less than one-and-half grains of alkaloid. The yellow bark is used in the form of decoction, extract, infusion, and tincture. The pale bark is contained in *Tinctura Cinchonæ Composita* and in *Mistura Ferri Aromatica*. The cinchona barks contain, besides the alkaloids, also certain acids having astringent properties, and are valuable as tonics in cases of great debility. (*Garrod's Mat. Medica.*) For properties of the alkaloids see QUININE and CINCHONINE. Cinchona barks rich in quinine generally contain much lime, and their solutions are precipitated by sodium sulphate. Cinchona barks are examined as follows: 100 grains of the yellow bark are reduced to powder, and are thoroughly exhausted by boiling, maceration, and percolation, with water acidulated with hydrochloric acid. The colouring matter is precipitated from the liquid by adding plumbic acetate, the solution being kept acid. It is then filtered, and to the filtrate caustic potash is added till the precipitate first formed by it is redissolved. This solution is then shaken with successive quantities of ether, till a drop of the ether evaporated to dryness leaves no residue. The ether solutions are then evaporated to dryness, and the residue of alkaloids is weighed. In testing the pale and red barks use chloroform instead of ether. When a bark containing quinine or cinchonine is heated in a test-tube a characteristic red vapour is given off, condensing to a carmine red liquid. It is also called Jesuit's bark and Peruvian bark.

cinchona bases, *s. pl.*

Chem.: Alkaloids contained in Cinchona bark. These can be separated from each other by adding ether, which dissolves the quinine and amorphous alkaloid, evaporating and dissolving in proof spirit acidulated with one-twentieth of sulphuric acid, and adding alcoholic iodine, which precipitates the quinine as iodo-sulphate, which is dried at 100°. One part equals 0·565 of quinine. To the liquid sulphurous acid is added, neutralised with caustic soda, and the alcohol expelled by evaporating on a water bath; on adding excess of soda the amorphous alkaloid is precipitated. The part insoluble in ether is dissolved in 40 parts of water and a little sulphuric acid, the solution being faintly alkaline. A solution of Rochelle salt $KNaC_4H_4O_4$ is then added, and it is allowed to stand for twelve hours. The cinchonidine is precipitated as tartarate, which is dried at 100°, and one part represents 0·804 of cinchonidine. To the filtrate iodide of potassium is added, which precipitates quinidine as hydroiodide. One part dried at 100° equals 0·718 of quinidine. To the filtrate caustic soda is added, which precipitates the cinchonine, which is dried at 100°. (See *Watts: Dict. of Chem.*)

çĭn-chŏn-ā′-çē-æ, *s. pl.* [Mod. Lat. *cinchon(a)*, and Lat. fem. pl. adj. suff. *-aceæ*.]

Bot.: A large order of plants belonging to an alliance called after it, Cinchonales. The calyx, which is simple, is superior, as is the corolla, which is tubular and of regular form. The stamens, which are definite in number, arise from the corolla all on the same line and alternate with its segments; the anthers are straight, bursting longitudinally. The ovary is inferior, usually two-celled, with few or many seeds; the fruit splitting into two cocci, or indehiscent and dry, or succulent. The leaves, which are simple, are opposite or verticillate, with interpetiolar stipules; this last character distinguishing them from the Galiaceæ, to which they are much akin. Lindley divides it into two tribes: *Coffeæ*, in which the ovary have only one or two seeds in each cell, and *Cinchoneæ*, in which it is many-seeded. (See these words.) In 1845, Lindley enumerated 269 genera, and estimated the known species at 2,500. Though none are British, yet they are so abundant in tropical countries as to constitute about one twenty-seventh part of the flowering plants. Some are trees, others shrubs, and yet others herbaceous plants. Many are most valuable tonics, febrifuges, emetics, and purgatives. [CINCHONA.] A few are poisonous, whilst, on the contrary, Coffee, which belongs to this order, is highly nutritive. Some have eatable fruits, and others are used in dyeing.

Chem.: C_8H_8 or C_6H_5–CH = CH_2. Styrolene, styrol, cinnamol, ethenyl-benzene, phenyl-ethylene. An aromatic hydrocarbon, obtained by distilling cinnamic acid with baryta; also by passing the vapour of xylene or a mixture of benzene vapour and ethene through a red-hot tube; also by distilling liquid storax and carbonate of sodium with water; synthetically by heating acetylene C_2H_2 in a glass tube over mercury to the softening point of the glass, four mols. of acetylene being condensed into one mol. of cinnamene. Cinnamene is a colourless oil. Sp. gr., 0·924. It boils at 145°. When heated to 200° in a sealed tube it is converted into a white transparent refractive solid called metacinnamene or metastyrolene, which when distilled yields liquid cinnamene. By the action of hydriodic acid cinnamene is chiefly converted into octane, C_8H_{18}. When cinnamene is agitated with a concentrated solution of iodine in potassium iodide, and the liquid is then diluted with water, crystals of iodide of cinnamene separate out. When cinnamene is oxidized with an alkaline solution of potassium permanganate, it yields benzoic and carbonic acids.

Chem.: Phenyl acrylic acid. Cinnamomic acid, $C_9H_8O_2$ or C_6H_5–CH=CH–CO·OH. A monatomic aromatic acid, obtained by the oxidation of cinnamon oil; it occurs in Peru and Tolu balsams. It unites directly with hypoclorous acid, HClO, forming C_6H_5–CHCl–CH(OH)–CO·OH, phenyl-chlor-lactic acid. It can be extracted by boiling these resins with milk of lime and filtering while hot, and decomposing the calcium cinnamate with hydrochloric acid. It has been formed by heating benzoic aldehyde in close vessels with acetyl chloride. It forms small crystals, which melt at 129°, and boil at 293°. Fused with potash, it yields potassium salts of benzoic and acetic acids, with evolution of hydrogen. It is slightly soluble in water and soluble in alcohol. It forms salts called cinnamates.

Chem.: C_9H_7OH. An aromatic aldehyde, found in the volatile oils of cinnamon and cassia, which are obtained from the genus Cinnamomum, order Lauraceæ. The aldehyde is separated as a crystalline compound with acid potassium sulphite. It is a colourless oil, boiling at 248°, which readily oxidises into cinnamic acid. When heated with nitric acid it yields benzoic acid and benzoyl hydride, C_6H_5·CO·H. By the action of chromic acid it is converted into benzoic and acetic acids.

A. *As subst.:* An aromatic substance consisting of the bark of a tree or trees. [Cinnamomum, Cinnamon Bark.] The Phœnicians, the Arabs, or both, imported the genuine cinnamon into Palestine remotely from Ceylon or the Eastern Archipelago, but probably from some mercantile port much nearer at hand. It is represented, however, as growing in at least one Jewish garden (Song of Solomon, iv. 14), unless, indeed, the whole description be figurative. It was one of the ingredients in the holy anointing oil, which Moses was commanded to make for the anointing of the tabernacle and its furniture (Exod. xxx. 22—29). It was used also for the perfume of beds (Prov. vii. 17). It is mentioned as an article of merchandise also in the mystic Babylon (Rev. xviii. 13).

3. The act or process of disseminating or spreading abroad.

B. *Technically:*

1. *Anat., Animal Physiol., &c.:* A movement of the blood throughout the human body. (For details see (2).)

(1) *Hist.:* The Spanish physician and theologian, Michael Servetus, whose end was so tragic, gained in 1553 some glimmering perception of the lesser or pulmonary circulation of the blood. Cæsalpinus in 1569 made a further advance towards the truth, but it was reserved for the immortal Harvey actually to make the great discovery, which he approached in 1615 and published with many details in 1628.

(2) *Physiol.:* The propelling force in the circulation of the blood is that of the heart, which is a hollow muscular organ placed in the centre of the sanguiferous system. The blood is driven by the heart into the aorta, and then circulated through the body by a set of vessels called arteries, which ramify into smaller and smaller tubes. [ARTERIES.] On reaching the extremities of the arteries it is driven through excessively fine tubes called, from their hair-like tenuity, capillaries. These, constituting the connecting channels between the arteries and the veins, afford it a passage into the latter vessels, by which it is conducted back to the heart. The heart is divided internally into four cavities, two at its base called auricles, and two at its body and apex called ventricles. The right is the venous side of the heart; it receives into its auricle the venous blood from every part of the body by the superior and inferior vena cava and coronary vein. In passing from the arteries to the veins the blood had lost its red color and acquired a dark hue; it is therefore discharged by the right auricle into the right ventricle, and thence transmitted along the pulmonary artery and its branches to the capillaries of the lungs, to be again brought in contact with the oxygen of the air. Returning to the left auricle it is immediately discharged into the left ventricle, thence to the aorta, to be propelled through the body as before. The current of the blood through the body in general is called the *greater* or *systemic circulation*; that to and from the lungs the *lesser* or *pulmonary* circulation. (*Quain, &c.*) There is a circulation either of blood or of a fluid analogous to it in the inferior animals. For an example see that under No. 2.

2. *Veg. Physiol.:* The circulation of plants is not closely analogous to that in animals. Formerly it was believed that there was an ascending current of sap in spring, and a descending one in autumn. It is now found that both an ascending and a descending current coexist, and when need arises these are supplemented by horizontal currents passing between the tissues. The ascending current enters the leaves, where it is submitted to certain influences which fit it for the nutrition of the plant. The descending carries it thence in an elaborated condition back to the root. (*Thomé, Brown, &c.*) [CYCLOSIS, ROTATION, &c.]

"The nutrient fluid, however formed, is distributed throughout the textures of the plant, or animal, by vital or physical forces, or by the junction of both; and the function, by which this is effected, is called *Circulation*. In plants this function is very simple and is formed without the agency of a propelling organ; but in the greatest number of animals, such an organ, 'a heart,' is the main instrument in the distribution of the blood. In animals then there is a true *circulation*, the fluid setting out from and returning to the same place. But in plants, the fluid is found to circulate or rotate, within the interior of cells, as in Chara and Vallisneria, the fluid of the cell not communicating with that of the adjacent ones; or to pass up from the spongioles in an ascending current and to descend in another set of vessels. But in many simple animals, some entozoa for example, and polygastrica, there is no good evidence of the existence of any *circulation* at all, their textures imbibing the fluid in which they live."—*Todd & Bowman: Physiol. Anat.*, vol. i., introd., pp. 23, 24.

3. *Finance:* Currency, circulating coin, notes, &c. In its early stages commerce was carried on by a direct exchange of articles which were reciprocally wanted, and in this form it is usually called "barter" or sometimes "exchange." An intermediate merchandise was then introduced called "money," and transactions in which money is used are not called "barter" but "sales." . . . A transaction in which any commodity or service is exchanged for money, instead of an equivalent, has been well called by J. B. Say a *demi-exchange*. And the conveniences of this method of conducting commerce so greatly preponderate over those of direct exchange or barter, that commerce is now almost entirely resolved into these demi-exchanges or sales. And this is the proper meaning of the word *circulation*. Barter or exchange is where two services of any kind are exchanged directly. Sale or demi-exchange, or *circulation*, is when any service is exchanged for some intermediate merchandise, which will enable its owner to obtain some service in exchange for it at some future time. (*Macleod: Dict. of Pol. Econ.*)

"The weekly issue increased to sixty thousand pounds, to eighty thousand, to a hundred thousand, and at length to a hundred and twenty thousand. Yet even this issue, though great, not only beyond precedent, but beyond hope, was scanty when compared with the demands of the nation. Church History:

1. The name given to a sect of the Donatists in Africa during the fourth century, from their habit of roving from house to house plundering. They went about in predatory gangs, consisting chiefly of rustics, pretending to reform public manners and redress grievances. They manumitted slaves without the consent of their masters, forgave debts, &c. In their zeal for martyrdom they courted death by insulting the Pagans at their festivals, and destroyed themselves in various ways.

I. *Literally:*

1. That which stands round or is attached to another.

* (1) *Of material things:* An adjunct, an accessary.

"The hollow orb of moving *circumstance*
Roll'd round by one fix'd law."

(2) *Of immaterial things:* Any matter or fact attending on or connected with another; an attendant state of things.

"That it is a known rule amongst all divines, that no certain argument can be drawn from the *circumstances* of a parable, but only from the main scope and intention of it."—*Tillotson* (3rd ed., 1722), vol. i. Ser xix.

Lewis: Cred. Early Roman Hist. (1855), ch. xii., pt. 1, § 15, vol. ii., p. 56.

¶ (1) Crabb thus distinguishes between a *circumstance* and a *situation*: "*Circumstance* is to *situation* as a part to a whole; many *circumstances* constitute a *situation*; a *situation* is an aggregate of *circumstances*. A person is said to be in *circumstances* of affluence who has an abundance of everything essential for his comfort; he is in an easy *situation* when nothing exists to create uneasiness. *Circumstance* respects that which externally affects us; *situation* is employed both for the outward *circumstances* and the inward feelings. The success of any undertaking depends greatly on the *circumstances* under which it is begun; the particular *situation* of a person's mind will give a cast to his words or actions. *Circumstances* are critical, a *situation* is dangerous."

(2) He thus discriminates between *circumstance*, *incident*, and *fact*: "*Circumstance* is a general term; *incident* and *fact* are species of *circumstances*. *Incident* is what happens; *fact* is what is done; *circumstance* is not only what happens and is done, but whatever is or belongs to a thing. To everything are annexed *circumstances* either of time, place, age, colour, or other collateral appendages which change its nature. Everything that moves and operates is exposed to *incidents*, effects are produced, results follow, and changes are brought about; these are *incidents:* whatever moves and operates does, and what it produces is done or is the *fact*. . . . *Circumstance* is as often employed with regard to the operations as the properties of things, in which case it is most analogous to *incident* and *fact:* it may then be employed for the whole affair, or any part of it, whatever that can be distinctly considered. *Incidents* and *facts* either are *circumstances*, or have *circumstances* belonging to them. . . . *Circumstance* comprehends in its signification whatever may be said or thought of any thing; *incident* carries with it the idea of whatever may befal or be said to befal any thing; *fact* includes in it nothing but what really is or is done. A narrative therefore may contain many *circumstances* and *incidents* without any *fact*, when what is related is either fictitious or not positively known to have happened: it is necessary for a novel or play to contain much *incident*, but no *facts*, in order to render it interesting; history should contain nothing but *facts*, authenticity is its chief merit." (*Crabb: Eng. Synon.*)

* **çĭr′-cŭm-stançe,** *v.t.* [CIRCUMSTANCE, *s.*] To place in a certain situation or position relatively to other things.

I. *Ordinary Language:*

1. *Of things:*

*2. *Of persons:* With an excessive attention to small events and details; precise, punctilious.

II. *Law:* Inferred from circumstances deduced indirectly, not by direct proof.

Circumstantial evidence: Evidence obtained from circumstances, which necessarily or usually attend facts of a particular nature, from which arises presumption; any evidence not direct and positive. A light, *i.e.* a slight presumption, has no weight or validity. A presumption of any kind is relied on only till the contrary has been proved. Still a probable presumption has considerable weight, and a violent one, that is one in which those circumstances appear which necessarily attend the fact, is in many cases held equal to full proof. (*Blackstone*, bk. iii., ch. 23.)

". . . what is popularly known as *circumstantial evidence*. No doubt, *circumstantial evidence*, when perfect, is the highest of all evidence . . ."—*Times*, Dec. 2nd, 1875.

¶ Crabb thus distinguishes between *circumstantial*, *particular*, and *minute*: "*Circumstantial* expresses less than *particular*, and that less than *minute*. A *circumstantial* account contains all leading events; a *particular* account includes every event and movement however trivial; a *minute* account omits nothing as to person, time, place, figure, form, and every other trivial *circumstance* connected with the events. A narrative may be *circumstantial*, *particular*, or *minute*; an inquiry, investigation, or description may be *particular* or *minute*, a detail may be *minute*. An event or occurrence may be *particular*, a *circumstance* or *particular* may be *minute*. We may be generally satisfied with a *circumstantial* account of ordinary events; but whatever interests the feelings cannot be detailed with too much *particularity* or *minuteness*." (*Crabb: Eng. Synon.*)

B. *As subst.:* Anything incidental or not essential to the main subject (generally in the plural).

"Who would not prefer religion that differs from our own in the *circumstantial*, before one that differs from it in essentials?"—*Addison: Freeholder.* (Latham.)

1. *Zool.:* A sub-class of Crustacea, unlike as the Barnacles and Acorn-shells ranked under the Cirripeda may appear to an edible crab or a lobster. For a long time indeed zoologists could not agree where to put the barnacles and acorn-shells till a discovery of their metamorphosis settled, or at least helped to settle, their true situation. On the 23rd April, Mr. V. Thompson, while crossing the ferry at the little town of Passage, 7½ miles E.S.E. of Cork, caught by means of a small muslin towing-net, numerous specimens of a small translucent animal about one-tenth of an inch long, which seemed a new species. Others of the same kind were collected on May 1st, 1826, and placed in a glass with salt water. On the 8th, two lost their power of locomotion and their eyes, and became acorn-shells (balani), as did the rest within a few days. In a paper read by Mr. Thompson before the Royal Society on March 5th, 1835, he shewed that the Lepades (barnacles proper) underwent an analogous transformation. He considered that these facts proved the acorn-shells and barnacles to be Crustaceans. So also, either before or afterwards, did M. Streus Durckheim, and Dr. J. Martin Saint Ange. The degradation of a change which converts a free and eyed animal into one fixed and eyeless has since been called Retrograde Development. The characteristics of the adult cirripedia are these: Adult attached enclosed in an integumentary sac, within which a many-valved shell is typically developed; antennæ modified for adhesion; abdomen free and rudimentary; thoracic segments usually carrying six pairs of forked ciliated limbs. Sexes generally united. The standard work on this sub-class is that by Darwin, published by the Ray Society. He divides it into three orders: (1) Thoracica, including the sessile families Balanidæ, Verrucidæ, and the pedunculated Lepadidæ; (2) Abdominalia; (3) Apoda. The cirripeds exist in nearly all seas. [BARNACLE.]

2. *Palæont.:* Only the Thoracica have been found fossil. As far as is yet known the Lepadidæ began in the Upper Silurian; Turrilepas, a genus ranked with the Balanidæ, but which may be Verrucidæ, in the Lias; an unequivocal specimen of the Verrucidæ in the Chalk, and undoubted Balanidæ in the Eocene and the Tertiaries. Pollicipes occurs in the Rhætic and Stonesfield Slate.

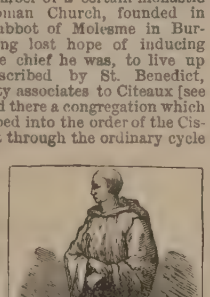
Çis-tẽr'-cian (cian as **shan),** *s. & a.* [Low Lat. *Cisterciensis*; Fr. *Cisteaux, Citeaux*, a convent situated near Dijon in France.]

A. *As substantive:*

Ch. Hist.: A member of a certain monastic order in the Roman Church, founded in 1098 by Robert, abbot of Molesme in Burgundy, who having lost hope of inducing the monks, whose chief he was, to live up to the rule prescribed by St. Benedict, retired with twenty associates to Citeaux [see etym.] and founded there a congregation which afterwards developed into the order of the Cistercians. It went through the ordinary cycle of such monastic institutions, *i.e.*, at first its members were poor and really holy; then the fame of their sanctity spreading through Europe, branches of the order were established in many places. To aid men so deserving, large contributions were given by pious men and women, and before the twelfth century had run its course, the Cistercian communities were wealthy.



CISTERCIAN MONK.

With the growth of this wealth, the gradual relaxation of the strict Benedictine rules took place, till finally the Cistercians lost their high reputation and sank to the level of the order against which their secession had been a protest, and to that of the monastic order generally. During the time that the order was rising in importance, it enjoyed the advocacy of the celebrated St. Bernard of Clairvaux, who is regarded as its second parent and founder, so that it is sometimes called the Bernardine order, or the order of St. Bernard. Between them and the Cluniacensians there was considerable animosity, and even public controversy. (*Mosheim: Church Hist.*, cent. xi., xii.)

¶ (1) Crabb thus distinguishes between *to cite* and *to quote*: "To *cite* is employed for persons or things; to *quote* for things only: authors are *cited*, passages from their works are *quoted*; we *cite* only by authority; we *quote* for general purposes of convenience. Historians ought to *cite* their authority in order to strengthen their evidence and inspire confidence; controversialists must *quote* the objectionable passages in those works which they wish to confute: it is prudent to *cite* no one whose authority is questionable; it is superfluous to *quote* anything that can be easily perused in the original."

(2) He thus discriminates between *to cite* and *to summon*: "The idea of calling a person authoritatively to appear, is common to these terms. *Cite* is used in a general sense, *summon* in a particular and technical sense: a person may be *cited* to appear before his superior; he is *summoned* to appear before a court: the station of the individual gives authority to the act of *citing*; the law itself gives authority to that of *summoning*. When *cite* is used in a legal sense, it is mostly employed for witnesses, and *summon* for every occasion: a person is *cited* to give evidence, he is *summoned* to answer a charge." (*Crabb: Eng. Synon.*)

citraconic acid, *s.*

$$\begin{matrix} CH_3 \\ | \\ C-CO.OH \\ \| \\ C-CO.OH \end{matrix}$$

Chem.: Pyrocitric acid $C_5H_6O_4$ or

A diatomic bibasic acid, isomeric with itaconic and mesaconic acids obtained by distilling citric acid; water is first given off at about 175°, vapours of acetone and CO, then the residue consists of aconitic acid; on continuing the distillation CO_2 is given off and itaconic acid is formed; afterwards water is given off, and an oily mass is left in the retort, consisting of citraconic anhydride, which, when exposed to the air, absorbs moisture and crystallises into citraconic acid, which melts at 80°. It unites readily with bromine, forming dibrompyrotartaric acid $C_5H_8Br_2O_4$. By the action of sodium amalgam, a solution of citraconic acid is converted into pyrotartaric acid $C_5H_8O_4$. When citraconic acid is subjected to electrolysis, it gives off $2CO_2$ and 2H, and yields allylene $CH_3—C{\equiv}CH$. By the action of hypochlorous acid HClO, citraconic acid is converted into chlorocitramalic acid $C_5H_7ClO_5$.

tetratomic tribasic acid, which occurs in the juice of lemons, also in gooseberries, currants, &c. It is obtained by allowing the juice to undergo an incipient fermentation, filtering and neutralising by means of powdered chalk, after which milk of lime, the insoluble calcium citrate, is precipitated, and is then decomposed by dilute sulphuric acid. It forms white crystals, soluble in water, and has an acid taste. It is used in dyeing and in calico-printing, and in the preparation of effervescent summer beverages. Citric acid fused with potash is decomposed into oxalic and acetic acids, thus $C_6H_8O_7 + H_2O = C_2H_2O_4 + 2(CH_3.CO.OH)$. Citric acid forms ethers. Citric acid has been formed synthetically from glycerin $CH_2OH.CHOH.CH_2OH$, by converting it into symmetrical dichlorhydrin, $CH_2Cl.CHOH.CH_2Cl$ by oxidizing this into dichloracetone $CH_2Cl.CO.CH_2Cl$, which forms with strong hydrocyanic acid an addition compound, cyano-dichloracetone, which by the action of HCl and H_2O is converted into di-

neutralised by Na_2CO_3, and heated with two mols. of KCN cyanide of potassium, which replaces the 2Cl by 2CN, forming sodium dicyanoacetonate; the solution is then saturated with HCl and heated in a water bath, and the citric acid precipitated by milk of lime as calcium citrate. Citric acid forms three series of salts with the alkalies, called citrates. It gives no precipitate with potassium acetate. Citrates of calcium, lead, and silver are insoluble. Citric acid, added to a solution in excess, prevents the precipitation of ferric oxide and of alumina by ammonia.

2. *Pharm.:* Citric acid acts as a refrigerant, and allays thirst and irritation of the skin. Citrate of ammonium increases the secretions. Citrate of iron and ammonia occurs in thin transparent deep-red scales, soluble in water, but almost insoluble in rectified spirit. It acts as a tonic, and is not astringent, and is given to restore the blood to a healthy condition. Citrate of iron and quinine occurs in greenish-yellow deliquescent scales soluble in water. It combines the therapeutic properties of iron and of quinine. Citrate of potassium, a white deliquescent powder, acts as a diuretic.

It has short and stiff branches, oblong toothed leaves, flowers purple externally, and fruit generally large, warted, and furrowed, having a protuberance at the apex, with a very thick spongy adherent rind and a subacid pulp. The Romans brought it from Media, where, however, it is not now, if it ever was, indigenous. It is at present cultivated in gardens in the warmer parts of both hemispheres. It furnishes oil of citron and oil of cedra.

çĭt'-rŭs, *s.* [Lat. *citrus;* Gr. *κίτρος* (*kitros*).]

Bot.: A genus of trees, the typical one of the order Aurantiaceæ. The leaves, which theoretically are compound, are reduced to a single leaflet, jointed to a leaf-like petiole. The stamens are numerous, and irregularly grouped into several parcels; the fruit, a hesperidium, has a leathery rind formed of the epicarp and mesocarp, which can easily be separated from the pulp below. The endocarp sends prolongations inwards, forming triangular divisions, in which pulpy cells are developed, so as to surround the seeds which are attached to the inner angle. The appropriate seat of the genus is believed to be the inferior ranges of hills in Nepaul and the sub-Himalayas, from which it may extend also into China. How many species are distinct is doubtful. Lindley and others think only one—the Citron (*Citrus medica*), a view to which the advance of Darwinism since Lindley's time will probably direct increased attention. There are various distinct forms in the genus Citrus, whether species or varieties, viz., the Citron, already mentioned, the Orange (*Citrus Aurantium*), the Lemon (*C. Limonum*), the Lime (*C. Limetta*), the Shaddock (*C. decumana*). Other varieties or sub-varieties are the Seville or Bitter Orange, sometimes called the Bigarade (*C. Bigaradia*), the Bergamot (*C. Bergamia*), the Mandarin Orange (*C. nobilis*), &c. [BERGAMOT, CITRON, ORANGE.]

(3) (See extract.)

"*Civil* law is defined to be that law which every particular nation, commonwealth, or community, has established peculiarly for itself . . . now more properly distinguished by the name of municipal law, the term *civil* law being chiefly applied to that which the old Romans used."—*Wharton.*

¶ (1) Crabb thus distinguishes between *civil* and *polite:* "These two epithets are employed to denote different modes of acting in social intercourse: *polite* expresses more than *civil;* it is possible to be *civil* without being *polite: politeness* supposes *civility* and something in addition. *Civility* is confined to no rank, age, condition, or country; all have an opportunity with equal propriety of being *civil*, but not so with *politeness*, that requires a certain degree of equality, at least the equality of education; it would be contradictory for masters and servants, rich and poor, learned and unlearned, to be *polite* to each other. . . . *Civility* is rather a negative than a positive quality, implying simply the absence of rudeness. *Politeness* requires positive and peculiar properties of the head and heart, natural and acquired. . . . The term *civil* may be applied figuratively, but *politeness* is a characteristic of real persons only."

(2) He thus distinguishes between *civil, obliging*, and *complaisant:* "*Civil* is more general than *obliging;* one is always *civil* when one is *obliging*, but one is not always *obliging* when one is *civil: complaisance* is more than either, it refines upon both; it is a branch of *politeness* (*v. Civil, polite*). *Civil* regards the manner as well as the action, *obliging* respects the action, *complaisant* includes all the circumstances of the action: to be *civil* is to please by any word or action; to be *obliging* is to perform some actual service; to be *complaisant* is to do that service in the time and manner that is most suitable and agreeable: *civility* requires no effort; to be *obliging* always costs the agent some trouble; *complaisance* requires attention and observation; a person is *civil* in his reply, *obliging* in lending assistance, *complaisant* in his attentions to his friends. One is habitually *civil; obliging* from disposition; *complaisant* from education and disposition: it is necessary to be *civil* without being free, to be *obliging* without being officious, to be *complaisant* without being affected." (*Crabb: Eng. Synon.*)

* 1. A list of the entire expenses of the civil government.

2. The revenue appropriated to support the civil government.

3. The officers of the civil government who were paid from the public treasury.

II. *In England:* The three meanings given above became more limited in their extent till finally they were confined to the list of expenses, the revenues and the dependents of the crown instead of the country.

¶ Originally it embraced the list of expenses of the crown, what now would be called the civil service, the army, the navy—everything.

¶ From the conquest in A.D. 1066 to the Restoration of Monarchy in A.D. 1660, all governmental expenses, whether those of the crown, the civil officers, the army, or the navy, now defrayed from a common fund, furnished partly by the revenues of the unsold crown

lands, and partly by taxation, the sovereign being left free to spend the money with uncontrolled freedom. At the restoration the military and naval expenses, which during war were necessarily great, were deemed extraordinary, and were withdrawn from the common fund, which was then appropriately called civil, as distinguished from military and naval. It supported the royal family, the judges, the various pensioners, &c. In 1830 the Civil List was limited to the charges required for the sovereign and his dependents. On the accession of Queen Victoria arrangement was made again regarding the Civil List, and in December, 1837, it was settled at £385,000. In 1881 it amounted to £407,468.

The law has worked well, though it has not been strictly observed.

civil state, *s.* The entire body of the laity or citizens, as distinct from the military, ecclesiastical, and maritime. (*Craig.*)

civil war, *s.* A war between citizens of the same country.

¶ The passage of the Rubicon by Julius Cæsar, which commenced the civil war between him and Pompey, took place in January, 49 B.C. The battle of Pharsalia, which decided its issue, was on August 9, 48 B.C. The assassination of Julius Cæsar, which led to the immediately succeeding civil war, was on March 15, 44 B.C., and the sea-fight of Actium, which finally decided its issue, on September 2, 31 B.C.

Coming to England, the first battle of St. Albans, the earliest in the wars of the Roses, was in A.D. 1455. That civil war may be supposed to have extended to the battle of Bosworth, August 22, 1485, and the accession of Henry VII., in whom the Houses of Lancaster and York, the antagonists in the late strife, were united. The first battle in the civil war which produced the Commonwealth and the Cromwellian Protectorate was that of Edgehill, October 23, 1642; that of Naseby, which decided the issue, was on June 14, 1645, though the struggle cannot be said to have finally terminated earlier than the accession of Charles II., who was proclaimed king on May 8, 1660.

The capture of Fort Sumter, at Charleston, in South Carolina, by the Secessionists, which was the first military operation in the American civil war, was on April 13, 1861. The surrender of General Lee to General Grant, on April 9, 1865, and that of General Kirby Smith, commandant of Galveston, on June 5 of the same year, were its final scenes.

2. The state of being civilized; refinement.

". . . occupied with taming the wild earth, and performing the functions of pioneers of *civilization*, . . ."—*Sir G. C. Lewis: On the Influence of Authority in Matters of Opinion*, ch. iii.

¶ Civilization consists in what may be broadly called culture in a nation; and a nation may be considered as civilized when a large proportion of those belonging to it have their intellectual and moral faculties and all their higher nature in large measure developed and becoming increasingly so with the advance of years. Before this can take place, a considerable amount of material prosperity must have been achieved, between which and the culture already described there are continual action and reaction.

At present barbarism, semi-civilization, and civilization are seen contemporaneously existing in the world, and the question suggests itself, How has this phenomenon been produced? In solving it inquiry needs to be made as to the original state of man. Individuals can move backward as well as forward in culture, and it is axiomatic that those aggregations of individuals called nations or races can do the same. The mass of men in this country believe Scripture to have decided that the present population of the earth has sprung from Noah's family, and that he and his household were far removed from barbarism. The contrary view that the original state of man was a barbarous one, an opinion generally held by the old Romans, has of late been revived, and has been embraced by many Darwinians and others. The Duke of Argyle has ably defended the more common hypothesis, whilst that recently revived is strongly maintained in Sir John Lubbock's "Origin of Civilization" (1870), Dr. Edward B. Tylor's "Primitive Culture" (1871), and other publications.

Regarding progression in material prosperity, certain stages tend to occur: (1) a barbarous one, in which one feeds on roots, fruits, and fishes, when these last can be caught without effort; (2) the state of a hunter; (3) that of the shepherd, in which, to avoid the uncertainty of the result in hunting, wild animals are domesticated; (4) the agricultural state, and (5) that of manufactures and commerce. Regarding mental advance, M. Auguste Comte, in publications issued between 1830 and 1854, maintained that nations necessarily passed through a theological, a metaphysical, and a positive or scientific stage. Littré in France (1845), and Buckle in England (1857—1861), ably and earnestly supported the same view.

"*Ask*, in the sense of *beg*, is confined to the expression of wishes upon the part of the *asker* without involving any obligation on the part of the person *asked*; all granted in this case is voluntary or complied with as a favour: but *ask for*, in the sense here taken, is involuntary, and springs from the forms and distinctions of society . . . To *ask for* denotes simply the expressed wish to have what is considered as due; to *claim* is to assert a right or to make it known; to *demand* is to insist on having without the liberty of a refusal . . . *Asking for* supposes a right not questionable; *claim* supposes a right hitherto unacknowledged; *demand* supposes either a disputed right [not always] or the absence of all right, and the simple determination to have." 1. A tribe or number of families, bearing the same surname, claiming to be descended from the same ancestor, and united under a chieftain representing that ancestor. The clan system is essentially the same as that existing among the Arabs, the Tartars, and tribes similarly situated. The clan system was said to have sprung up in Scotland about 1008, while Malcolm II. was reigning, but it may have been of greater antiquity. In the Act 20 Geo. II. c. 43, passed in 1747, the legal authority of the chiefs over their followers was abolished as a punishment for the part which the former had taken in the insurrection which ended in 1745 at Culloden. Whilst the clans flourished they were divided into two, the clans of the borders and those of the highlands.

¶ Crabb thus distinguishes between *clandestine* and *secret*: "*Clandestine* expresses more than *secret*. To do a thing *clandestinely* is to elude observation: to do a thing *secretly* is to do it without the knowledge of any one: what is *clandestine* is unallowed, which is not necessarily the case with what is *secret*. With the *clandestine* must be a mixture of art; with *secrecy*, caution and management are requisite; a *clandestine* marriage is effected by a studied plan to escape notice; a *secret* marriage is conducted by the forbearance of all communication." (*Crabb: Eng. Synon.*)

clăr'-ĕt, *s.* & *a.* [Fr. *clairet*, from *clair*; Lat. *clarus* = clear; Ital. *claretto.*]

A. *As substantive:*

1. *Lit.:* A name originally given to wines of a light-red color, but now ordinarily applied to the red wines imported from France, chiefly from Bordeaux. These wines vary in composition according to the locality, season, and age, but the produce of each vineyard usually retains its own peculiar characteristics. The most esteemed are those produced at the vine-

yards of Lafitte, Latour, Chateau Margaux, and others. Many of the clarets sold in this country are nothing more than the *vin ordinaire* used by the French peasants and working classes. A genuine claret should contain from 16 to 20 per cent. of proof-spirit. Fictitious clarets are sometimes prepared by mixing a rough cider with a cheap French wine, and colouring with cochineal, logwood, elderberry, hollyhock, indigo, litmus, red cabbage, beetroot, or ros-aniline. To detect these colouring matters make a jelly by dissolving five grammes of gelatine in 100 cubic centimetres of warm water, and pour it into a square flat mould. From this cake of jelly cubes about three-quarters of an inch square are cut with a sharp wet knife, and are immersed in the wine; they are taken out after twenty-four to forty-eight hours, washed slightly, and sections cut in order to see how far the colouring matter has penetrated. If the wine is pure, the colour will be confined to the edges of the slice, or will not have penetrated more than one-eighth of an inch. The colouring matters mentioned above permeate rapidly, and colour the jelly. For other adulterations of wine, &c., see *Blyth's Manual of Practical Chemistry.*

¶ Crabb thus distinguishes between *class, order, rank,* and *degree:* "*Class* is more general than *order; degree* is more specific than *rank. Class* and *order* are said of the persons who are distinguished; *rank* and *degree* of the distinction itself; men belong to a certain *class* or *order:* they hold a certain *rank,* they are of a certain *degree.* Among the Romans all the citizens were distinctly divided into *classes* according to their property; but in the modern constitution of society *classes* are distinguished from each other on general, moral, or civil grounds; there are reputable or disreputable *classes;* the labouring *class,* the *class* of merchants, mechanics, &c. *Order* has a more particular signification; it is founded upon some positive civil privilege or distinction; the general *orders* are divided into higher, lower, or middle. . . . [Though we say the lower *orders* or *classes,* yet the expression the upper *classes* and the middle *classes* is the common one, and the term *orders* is rarely used of them.] *Rank* distinguishes one individual from another; it is peculiarly applied to the nobility and the gentry, although every man in the community holds a certain *rank* in relation to those who are above or below him. *Degree,* like *rank,* is applicable to the individual; but only in particular cases; literary and scientific *degrees* are conferred upon superior merit in different departments of science. There are likewise *degrees* in the same *rank,* whence we speak of men of high and low *degree.*" (*Crabb: Eng. Synon.*)

* **B.** *Intrans.:* To be grouped or arranged in

a class; to fall naturally into a certain division or group.

¶ Crabb thus distinguishes between to *class*, to *arrange*, and to *range*: "The general qualities and attributes of things are to be considered in *classing*; their fitness to stand by each other must be considered in *arranging*; their capacity for forming a line is the only thing to be attended to in *ranging*. *Classification* serves the purposes of science; *arrangement* those of decoration and ornament; *ranging* those of general convenience: men are *classed* into different bodies according to some certain standard of property, power, education, occupation, &c.; furniture is *arranged* in a room according as it answers either in colour, shade, convenience of situation, &c.; men are *ranged* in order whenever they make a procession . . . When applied to spiritual objects, *arrangement* is the ordinary operation of the mind, requiring only methodical habits: *classification* is a branch of philosophy which is not attainable by art only; it requires a mind peculiarly methodical by nature, that is capable of distinguishing things by their generic and specific differences; not separating things that are alike; nor blending things that are different: books are *classed* in a catalogue according to their contents; they are *arranged* in a shop according to their size or price; they are *ranged* in a counter for convenience." (*Crabb: Eng. Synon.*)

2. *Nat. Science:* Animals, plants, and minerals are carefully classified by naturalists. Though the use of the term classification may seem to imply that these are placed in classes only; yet these are only one of the numerous designations of the several categories in which they are placed. Linnæus arranged all natural objects in the earth under the head *Imperium Naturæ* (the Empire of Nature). He divided it into *Regnum animale* (the Animal Kingdom), *Regnum vegetabile* (the Vegetable Kingdom), and *Regnum lapideum* (the Stony or Mineral Kingdom). Each is next divided by him into *Classes* (Classes), *Ordines* (Orders), Genera and Species, what are now called varieties being occasionally discriminated. His categories, larger or smaller, were consequently seven: Empire, Kingdom, Class, Order, Genus, Species, Variety. The most comprehensive term now employed in zoology is Subkingdom, immediately below which comes the Phylum (a term very generally substituted for Class, and intended to show genetic relationship), then Order, Family, Sub-family, Genus, Species, and finally Variety or Subspecies. Synonymous terms, such as group, section, sub-section, &c., are sometimes used in lieu of some of those given above. The names of zoological families should properly end in *idæ*, and sub-families in *inæ*, and in botany alliances end in *ales* and orders as a rule in *aceæ*. Uniformity in such terminology is very desirable, and the present practice is in that direction.

¶ For the difference between natural and artificial systems of classification, see System. For particular systems, now obsolete, see Binary and Quinary. As bearing on present views of the philosophy of classification, see also Darwinism, Species, &c.

In classifying animals or plants, care must be taken to distinguish between *analogy* and *affinity* (see these words). It is only when there is affinity between two species, two genera, &c., that they should be put together. A linear classification is not conformable to nature. For the binomial method of naming objects of natural science, see Nomenclature.

II. *Technically:*

1. *Min.:* Clay is composed of hydrous silicate of aluminium, usually with a mechanical admixture of sand, iron oxides, and other substances. In the earlier mineralogies clay figured under that simple name as a mineral genus with many species under it, or as a species with many varieties. Thus in the second edition of Phillips's "Mineralogy" eighteen minerals figure as kinds of clay. In the fourth edition (1837)—that by Robert Allan, F.R.S.E., &c.—these are reduced to thirteen, viz.: (1) Slate-clay or shale, (2) Adhesive Slate, (3) Polishing Slate, (4) Lithomarge, (5) Fuller's Earth, (6) Tripoli, (7) Bole, (8) Lemnian Earth, (9) Cimolite, (10) Mountain Meal, (11) Black Chalk, (12) Pipe-clay, and (13) Potter's Clay. In Dana, clay of different kinds figures simply as a synonym of various minerals. In the "British Museum Catalogue" there is a category of clays. A great many minerals have more or less of alumina in their composition; its presence may often be detected by the peculiar smell which the mineral emits when breathed upon. The colour of clay chiefly depends upon its containing the iron in a ferrous or a ferric state. Some of the dark-coloured oolitic clays contain large quantities of a bituminous matter; these clays give off a most offensive odour when burnt into bricks.

2. *Chem.:* Clay is principally hydrous silicate of aluminium, $Al_2O_3{\cdot}2SiO_2{\cdot}2H_2O$. The purest clay is called Kaolin (q.v.). Clays generally contain much free silica, also calcium carbonate, calcium sulphate, oxide of iron, magnesium carbonate, and small quantities of alkaline salts, phosphates, and iron pyrites. Fire-clay is more refractory the greater the percentage of alumina which it contains in proportion to the fluxes (alkalies,

alkaline earths, and ferrous oxide), and the smaller the quantity of the silica in proportion to the silicate of aluminium. Clay possesses the property of absorbing ammonia and organic matter, &c., from liquid sewage applied to its surface, and thus not only promotes the growth of agricultural crops, but also purifies water percolating slowly through it. For analysis of Fire-clay, see *Watts's Dict. of Chem.*, 2nd Supt., p. 335.

3. *Geol. & Palæont.:* Clay is simply mud produced by the wearing down of rocks. If a stream bring down sediment into still water, the heavier boulders fall first, the pebbles next, then gravel, after which little remains but fine silt, which makes the water look turbid for a time, but gradually settles down at the bottom, and becomes mud or clay. Clay suspended in water is precipitated by the addition of sea-water. Sterry Hunt made experiments on the water of the Mississippi. (*Chem. News*, xxx., p. 97.) Hence the deposits of mud formed at the entrance of the river into the Gulf of Mexico. When hardened into a thinly laminated rock, and perhaps coloured black by carbonaceous matter, it becomes shale. A form of it called Fire-clay exists in the coal measures just beneath each seam of coal; it constituted the vegetable soil in which the ancient forest, the remains of which have been transformed into coal, grew. Whilst sandstone is, as a rule, too porous to retain fossils uninjured, clay, shale, or anything equivalent does so admirably, and a palæontologist should give particular attention to every finely laminated stratum which he may see in any series of rocks which he proposes to examine.

(1) The act of cleaving or splitting a crystal in a certain direction in which it is easy to do so; the state of being so cleft. This line of easy fissure, as a rule, is parallel to one or more of the faces of the crystal. Cleavage tends to reduce a mineral to the form of its primary or primitive crystal.

(2) The line along which such splitting takes place.

"In building up crystals these little atomic bricks often arrange themselves into layers which are perfectly parallel to each other, and which can be separated by mechanical means; this is called the *cleavage* of the crystal."—*Tyndall: Frag. of Science* (3rd. ed.), xiv. 407.

3. *Geology:*

(1) The act or capability of cleaving certain slaty rocks into an indefinite number of thin laminæ, parallel to each other but not parallel to the planes of stratification (*Lyell*); the state of being so cleft.

(2) The cleft or fissure which is thus produced. Cleavage is divided into laminar fission, or Flaggy Cleavage, coincident with bedding planes, and Slaty Cleavage, deviating from the direction of the bedding planes. Slaty Cleavage is a fissile structure in certain slaty or other rocks distinct from both stratification and joints, though in some cases liable to be mistaken for one or other of these. It most frequently occurs in clay-slate, or other argillaceous rock, next in frequency to which it is found in gneiss, mica-schist, hypogene-limestone, &c. Murchison, in his "Siluria," shows that slaty cleavage exists in the Silurian and other older rocks, and in those of Devonian age. It is not uncommon in the carboniferous rocks of Ireland, but less so in that formation generally. Slaty cleavage, or slaty texture, has been superinduced by the rock having been subjected to great pressure, which also affects any fossils which the rock may contain, squeezing and distorting them to a considerable extent. Flaggy cleavage has been produced by the regular deposition of thin layers of sediment one upon another. Slaty cleavage is seldom met with in rocks of eruptive origin, except in beds of volcanic ash, and occasionally in some of the older lavas. A structure, called Foliation, resembling laminar fission, is found in altered sedimentary rocks. It is due to the segregation of any one mineral component of the rock along a more or less regular plane, and thus differentiating the rock into a series of alternating layers of different composition.

Traveller's Joy or Virgin's Bower, is a climbing plant with pinnate leaflets, twining petioles and greenish-white flowers. It occurs wild in the middle and south of England. *C. Gouriana* and *C. Wightiana* are not uncommon in India, on the Western Ghauts, in the Deccan, &c., and there are other Indian species. On the continent of Europe, *C. erecta* and *C. flammula* are used by beggars to produce artificial ulcers on their limbs, whilst in America, according to Geyer, the root of a clematis is employed by the North American Indians as a stimulant to horses which fall down at their races. The scraped end of the root is held to the nostrils of the fallen animal, which begins to tremble, and then rising is conducted to water to refresh itself. Various species of clematis are found in English gardens and greenhouses.

"It was even suspected that he sent some persons to the gibbet solely because they had applied for the royal *clemency* through channels independent of him."—*Macaulay: Hist. Eng.*, ch. v.

† 2. *Of the elements:* Mildness, softness.

"Then in the *clemency* of upward air." *Dryden.*

¶ Crabb thus distinguishes between *clemency*, *lenity*, and *mercy*: "*Clemency* and *lenity* are employed only towards offenders; *mercy* towards all who are in trouble, whether from their own fault or any other cause. *Clemency* lies in the disposition; *lenity* and *mercy* in the act; the former as respects superiors in general, the latter in regard to those who are invested with civil power: a monarch displays his *clemency* by showing *mercy*; a master *lenity* by not inflicting punishment where it is deserving. *Clemency* is arbitrary on the part of the dispenser, flowing from his will independent of the object on whom it is bestowed; *lenity* and *mercy* are discretionary, they always have regard to the object and the nature of the offence, or misfortunes; *lenity* therefore often serves the purposes of discipline, and *mercy* those of justice by forgiveness, instead of punishment; but *clemency* [sometimes] defeats its end by forbearing to punish where it is needful." (*Crabb: Eng. Synon.*)

The former of these appellations comprehended the body of the Christian people; the latter according to the signification of the word, was appropriated to the chosen portion that had been set apart for the service of religion."—*Gibbon: Decl. & Fall*, ch. xv.

II. *Technically:*

1. *Theology:*

(1) The chief New Testament passages to which the word clergy is ultimately traceable back are two. One is 1 Pet. v. 3, where the elders are exhorted not to be lords over God's "heritage" (Auth. Vers.), or lording it over the "charge allotted to you" (Revised Vers.). The words in the Greek are τῶν κλήρων (*tōn klērōn*), the genit. pl. of κλῆροι (*klēroi*), the same word which is used by the Greek ecclesiastical writers for clergy. In the passage in St. Peter it obviously means the whole body of believers in any particular congregation, or in the church collectively viewed as "God's heritage," or as a pastor's charge. The word "God" in the Authorised Version was, as its being spelled in italics shows, inserted by King James's translators; it is not in the original. In the second passage, Acts i. 15—26, the word κλῆρος (*klēros*) is used of the apostolate from which Judas fell, and to which Matthias was elected (verses 17, 25), and the plural κλῆροι (*klēroi*), of the lots cast to decide his election (v. 26).

(2) The verse in St. Peter [No. (1)] doubtless alludes to a multitude of Old Testament passages in which the Israelites are described as the inheritance or heritage of God (Deut. xxxii. 9, Psalms xxviii. 9, lxxviii. 71, Jer. x. 16, Joel ii. 17, &c., &c.); as also is the country of Canaan (1 Sam. xxvi. 19, 2 Sam. xxi. 3, Psalm lxviii. 9, &c., &c.). The word in these and various other passages is κληρονομία (*klēronomía*), a derivative of κλῆρος (*klēros*). Its primary etymological meaning is *lot* (see etym.), and it is used with tacit reference to the distribution to the several tribes of their respective possessions by lots (Num. xxvi. 52—56, Joshua xiv. 1—3, xv. 1, xvi. 1, &c., &c.). When the distribution took place, the Levites received no territory as a heritage, God being their inheritance (Num. xviii. 20, Deut. x. 9, xviii. 1, 2), as was also the priesthood of some of them (Joshua xviii. 7); the sacrifices of Jehovah made by fire (Joshua xiii. 14), and tithes (Num. xviii. 21—24, Deut. xiv. 28, 29). Reciprocally God claimed them as his special servants, taking them in lieu of the first-born devoted to him when the Egyptian first-born were slain (Exod. xiii. 11, 12, 13, 15, Num. iii. 12, 45, viii. 17, 18). He said of them "The Levites shall be mine." An analogy being drawn between the special position of the Levites and that of the Christian ministry as alike ordained to spiritual functions, the word κλῆροι (*klēroi*), used originally by St. Peter of all church members, became limited to their spiritual chiefs.

2. *Church History:*

(1) *In the Early Church:* St. Paul accepted scarcely anything from those to whom he ministered (Acts xx. 33, 34, and 2 Cor. xi. 9), his general practice being to support himself by tent-making (Acts xviii. 3), but he let it be understood that as a rule those who preached the gospel should live of the gospel (1 Cor. ix. 13, 14). This support enabled the pastors of the several churches at a very early period of Christianity to withdraw from secular occupations and give their whole time to their sacred calling.

(2) *In mediæval times:* Century by century almost to the time of the Reformation, or at least till about 1300 A.D., the power and influence of the clergy went on to increase. As every instance of notorious vice on the part of one discharging sacred functions weakens the order to which he belongs, whilst every case of conspicuous virtue increases it, the clergy never could have obtained the influence which they did unless at least a vast section of their number had been really spiritual men. They had other advantages of no mean kind. The only educated class [Benefit of Clergy]; members of an international society existing wherever Christianity had rooted itself; the sole administrators of the sacraments, and in confraternity with a chief believed to have the keys of the kingdom of heaven, the clergy had every opportunity of rising to transcendent power over the imagination, the consciences, and ultimately the earthly possessions of men. Availing themselves of these advantages they actually rose to a pitch of authority which perhaps no other priesthood except that of the Indian Brahmans ever rivalled. Their rule was for a time an advantage to Europe. It was knowledge ruling over ignorance, at least partial refinement holding in control lawless violence; a ladder by which the humblest could climb to great heights of society, whilst outside the church genius of humble birth was prevented from rising, being held down by the weight of feudal chains. But not even a sacred order of men are to be trusted with nearly absolute power, and at length the pretensions of the clergy converted most civil governments into their thinly disguised foes. [Guelphs, Ghibellines, &c.] Means were taken to abridge their power, each new scheme being, as Blackstone shows, ingeniously evaded, and finally their tyranny and rapacity, rather than their doctrinal views, excited a great part of Europe against them, and brought on the great revolt against their domination known as the Reformation. During the mediæval period the monastic orders were looked upon as belonging to the clergy. Abbots, priors, monks, &c., were known as the regular clergy, and bishops, deans, priests, &c., as the secular clergy.

(3) *Post-reformation times:* The civil governments on one hand, and the lay members of the several churches on the other, gained back from the clergy, in countries where the Reformation was successful, a great part of what they had lost during times of greater ignorance. For details see Reformation, Royal supremacy, &c.

*** clĕv'-ĕr, * clev-ere,** *s.* [CLEAVER (2).]

clĕv'-ĕr, *a.* [The etymology is doubtful. Wedgwood thinks the word was derived from the notion of seizing, as Latin *rapidus* from *rapio*; Scotch *gleg* = quick of perception, clever, quick in motion, expeditious, from Gaelic *glac* = to seize, to catch. The Scots has also *cleik, clek, cleuck, cluke, clook* (identical with English *clutch*) = a hook, a hold, claw, or talon; to *clek* or *cleik* = to catch, snatch, and hence *cleik, cleuch* = lively, agile, clever, dexterous, light-fingered. One is said to be *cleuch* of his fingers who lifts a thing so *cleverly* that bystanders do not observe it. (*Jamieson.*) Now the Old English had a form *cliver* = a claw or clutch, exactly corresponding to the Scotch *cleik, cluik*. Hence the Old English to *clever*, Dutch *klaveren, klevern* = to claw oneself up, climb, scramble; and hence also he believes is formed the adjective *clever* in the sense of snatching, catching, in the same way as the Scotch *cleik, cleuch*, above mentioned. Dut. *kleverig* = sticky; Low Ger. *klevisk, klefsk; klefske finger* = thievish fingers, to which everything sticks." Another derivation is that suggested by Rev. A. S. Palmer (*Leaves from a Word-hunter's Note-book*, ch. x.), which Prof. Skeat seems inclined to adopt, that it is a modification of Mid. Eng. *deliver* = nimble, active. Prof. Skeat adds that it is not unlikely that this modification has been aided by a Prov. Eng. *cliver, clever* = ready to seize.] [DELIVER, *a.*]

*4. Fit, apt, proper, suitable.

5. Good-natured; possessing an agreeable disposition. (*American.*) (*Webster.*)

¶ Crabb thus distinguishes between *clever, skilful, expert, dexterous*, and *adroit*: "*Clever* and *skilful* are qualities of the mind; *expert, dexterous*, and *adroit*, refer to modes of physical action. *Cleverness* regards in general the readiness to comprehend; *skill* the maturity of the judgment; *expertness* a facility in the use of things; *dexterity* a mechanical facility in the performance of any work; *adroitness* the suitable movements of the body. A person is *clever* at drawing who shows a taste for it, and executes it well without much instruction; he is *skilful* in drawing if he understands it both in theory and practice; he is *expert* in the use of the bow if he can use it with expedition and effect; he is *dexterous* at any game when he goes through the manœuvres with celerity and an unerring hand; he is *adroit* if by a quick, sudden, and well-directed movement of his body, he effects the object he has in view. . . . *Cleverness* is rather a natural gift; *skill* is *cleverness* improved by practice and extended knowledge; *expertness* is the effect of long practice; *dexterity* arises from habit combined with agility; *adroitness* is a species of *dexterity* arising from a natural agility." (*Crabb: Eng. Synon.*)

A. *As adj.:* Critical, dangerous; pertaining to the great climacteric [B.], or to any one of lesser peril.

B. *As subst.:* One of certain periods of a man's life in which his constitution is said to undergo great changes, involving him in danger till they are over. They are multiples of 7 or of 9, as 35, 49, 81. The most perilous of these, called by way of eminence the grand climacteric, is his 63rd year—for 9 × 7 = 63. The 7th year of life is also dangerous. The grand climacteric of life is said to have been recognised by Hippocrates.

Climacteric disease:

Med.: A disease affecting both men and women, but more obvious in the former. It may be looked for about the 63rd year of age, but varies in the time of its coming according to the constitution of the individual, the limits being in the one direction 50, and in the other 75. Its most common predisposing cause is mental anxiety or suffering. The expression of the countenance alters for the worse, the pulse becomes accelerated, the flesh wastes away without obvious cause; there are sleepless nights, and wandering pains flit through the head and chest, and sleep is either deficient or brings little refreshment. After a time recovery as a rule takes place, but the countenance never recovers its former aspect, or the constitution its vigour.

* **clī-ma-tăr'-chĭc,** *a.* [Gr. κλίμα (*klima*), (genit. κλίματος (*klimatos*) = a climate; ἄρχω (*archō*) = to rule, to govern.] Presiding over or regulating the climates.

clī'-mate, * **cli-mat,** * **cly-mat,** * **cly-mate,** *s.* [Gr. κλίμα (*klima*); κλίνω (*klinō*) = to cause to bend or slant. (1) The inclination or slope of ground; (2) a slope imagined by the ancients of the globe from the equator to the pole; (3) a zone or a parallel of latitude, the space between these parallels of latitude held to be synonymous with a climate.]

I. *Ordinary Language:*

* 1. *In the Greek sense:*

"*Climate*, a portion of the earth contained between two circles parallel to the equator."—*Phillips: The New World of Words.*

2. *In a sense intermediate between the Greek one and that presently in use:* A country, a region.

"The *climate* of Gaul [Galliarum plagam] is enclosed on every side with fences that environ it naturally."—*Holland: Reminiscences*, p. 47.

3. Characteristic condition of a country or district with regard to weather; meteorological conditions viewed as a whole. (II.)

II. *Meteorology:*

(1) *Present climate of the several parts of the world:* The most potent causes regulating climate are latitude on the one hand, and elevation above the sea level upon the other, the former cause producing perpetual snow and ice around the North and South Poles, and the latter acting with similar effect on the summits of such mountain chains as the Himalayas or the Andes. Were these the sole causes, lines of equal temperature, or, as they are technically called, Isothermal lines, would coincide with circles of latitude; instead of doing this however, they are parallel neither to the equator nor to each other. [ISOTHERMAL.] In addition to the two above-mentioned causes, must be reckoned also the position and direction of the several continents and islands, the position and depth of the seas, and the direction of currents and winds. Our own country is often tacitly assumed to be the normal climate by which all others are to be tested; in reality, being an island, whilst most of the land existing in the world is distributed in continents, its climate is one of an exceptional character. It is of the type called insular, that is, such as exists in an island in which the sea diminishes the difference in temperature between summer and winter and between night and day. The normal type of climate, that existing on continents, is called excessive; in it a great difference exists between the temperature of summer and that of winter, as well as between that of the night and that of the day. Asia and North America are the best existing examples of excessive climates. In Britain an east wind, blowing in winter over the frozen steppes of Russia, is cold and dry; a south wind in summer coming over the continent of Europe, if not even remotely from the Sahara, is hot and dry, whilst a south-west wind, bringing heat, moisture, "depressions" innumerable, and in some cases even spent cyclones from the warm surface of the Atlantic, is the parent of heat, rain, and storm.

(2) *Past climate of the several countries of the world:* There is distinct geological evidence that the climate of the world has oscillated in time past, being, in Europe and North America at least, higher at one time and at another lower than now. During the carboniferous period the vegetation and the animal life too were so uniform from the Arctic zone to the equator, that the temperature must have varied little in different latitudes, and little also between summer and winter. The temperature of the Permian is doubtful; during a portion of it there may have been a glacial period. The stony corals of the oolite naturally suggest a tropical or all but tropical climate. The temperature of the eocene was high. It slowly fell, however, during the miocene and the older pliocene, till in the upper pliocene it was for a time absolutely glacial. Since that comparatively recent geological event, it has risen to what we have it now. Sir Charles Lyell considered that bygone changes were probably produced by different distributions of land and water over the globe, a glacial period coming when a great deal of land, and that high land, was round the poles, and one of great heat when most of the land was round the equator. Mr. Croll, on the contrary, following in a direction in which Sir John Herschell led the way, believes that minute alterations on the ellipticity of the earth's orbit will produce oscillation of temperature in one direction for 10,500 years, and then in the other for the same lengthened period of time. [GLACIAL PERIOD.]

". . . the inordinately great change of *climate*, on the prodigious lapse of time, all included within this same glacial period."—*Darwin: Origin of Species* (ed. 1859), ch. ix., p. 294.

¶ Crabb thus distinguishes between to *arise* or *rise*, to *mount*, to *ascend*, to *climb*, and to *scale*: "The idea of going upwards is common to all these terms; *arise* is used only in the sense of simply getting up, but *rise* is employed [either in that sense or] to express a continued motion upward: a person *arises* [or *rises*] from his seat or bed; a bird *rises* in the air, the silver [quicksilver] of the barometer *rises*: the three first [first three] of these terms convey a gradation in their sense; to *arise* or *rise* denotes a motion to a less elevated height than to *mount*, and to *mount* that which is less elevated than *ascend*: a person *rises* from his seat, *mounts* a hill, and *ascends* a mountain. *Arise* and *rise* are intransitive only; the rest are likewise transitive . . . *Climb* and *scale* express a species of rising; to *climb* is to rise step by step by clinging to a certain body; to *scale* is to rise by an escalade or species of ladder employed in mounting the walls of fortified towns; trees and mountains are *climbed*; walls are *scaled*." A *mask* only hides the face; a *mask* therefore serves to conceal only as much as words and looks can effect. A *blind* is intended to shut out the light and prevent observation; whatever, therefore, conceals the real truth, and prevents suspicion by a false exterior, is a *blind.* A *veil* prevents a person from seeing as well as being seen; whatever, therefore, obscures the mental sight acts as a *veil* to the mind's eye." ¶ *O'clock* = of the clock, is used as equivalent to *by the clock;* as, *what o'clock is it?* = *what time is it by the clock?*

"What is't *o'clock?*—Upon the stroke of four."—*Shakesp.: Richard III.*, iii. 2.

II. *Technically:*

1. *Horol.:* An instrument differing from a watch in not being adapted to be carried on the person, and having a motive weight or spring, a train of gearing, index hands, and figured dial, and a pulsative device to determine the rate at which the mechanism shall move.

(1) *Hist.:* The dial was an early invention for keeping time. [DIAL.] The clepsydra followed next. [CLEPSYDRA.] One of these latter instruments, that of Plato, B.C. 372, was made to sound upon organ-pipes the hour of the night when the dial could not be seen. Wheel-work set in motion by springs and weights was known in the time of Archimedes, 287—212 B.C., and applied to mechanical engines and toys. Two other appliances were needful to make a clock, viz., to join the wheels to a pointer which traversed the dial, and to contrive a mode of regulating the speed of the going-works. When these features were united to complete the mechanism of a clock is not known. About A.D. 1000 Ebu Junis, of the Saracenic University of Cordova, in Spain, had a pendulum clock to which it is thought that Gerbert, a student at that seat of learning, and afterwards Pope Sylvester II., added the escapement. In A.D. 1288, a clock was placed in the palace yard, London, and shortly after that date they began to be supplied to cathedrals, churches, palaces, town halls, &c., till at length they became numerous everywhere.

(2) *Kinds of clocks now in use:*

(*a*) A *church clock* is called in the trade a tower clock; its external appearance is familiar to everyone.

(*b*) A *chiming clock,* sometimes called a musical clock, is one in which the hours or fractions are marked by a carillon. These instruments were first made in Germany as early as A.D. 1580.

6. *To close with the land:*

Naut.: To come near to the land.

¶ (1) Crabb thus distinguishes between to *close* and to *shut*: "*Close* is to *shut*, frequently as the means to the end. To *close* signifies simply to put together; to *shut* signifies to put together so *close* that no opening is left. The eyes are *shut* by *closing* the eyelids; the mouth is *shut* by *closing* the lips. The idea of bringing near or joining is prominent in the signification of *close*; that of fastening or preventing admittance in the word *shut*. By the figure of metonymy, *close* may be often substituted for *shut*; as we may speak of *closing* the eyes or the mouth; *closing* a book or a door in the sense of *shutting*: but they are, notwithstanding, very distinct. Many things are *closed* which are not to be *shut*, and are *shut* which cannot be *closed*. Nothing can be *closed* but what consists of more than one part; nothing can be *shut* but what has or is supposed to have a cavity. A wound is *closed*, but cannot be *shut*; a window or a box is *shut*, but not *closed*. When both are applied to hollow bodies, *close* implies a stopping up of the whole, *shut* an occasional stoppage at the entrance. What is *closed* remains *closed*; what is *shut* may be opened. A hole in a road, or a passage through any place is *closed*; a gate, a window, or a door, is *shut*."

(2) He thus discriminates between to *close*, to *finish*, and to *conclude*: "To *close* is to bring to an end; to *finish* is to make an end: we *close* a thing by ceasing to have anything more to do with it; we *finish* it by really having no more to do to it. We *close* an account with a person with whom we mean to have no farther transactions; we *finish* the business which we have begun. It is sometimes necessary to *close* without *finishing*, but we cannot *finish* without *closing*. The want of time will compel a person to *close* his letter before he has *finished* saying all he wishes. . . . *Close* and *finish* are employed generally, and in the ordinary transactions of life; the former in speaking of times, seasons, periods, &c., the latter with regard to occupations and pursuits; *conclusion* is used particularly on moral and intellectual operations. A reign, an entertainment, an age, a year, may have its *close*; a drawing, an exercise, a piece of work, may be *finished*; a discourse, a story, an affair, a negotiation, may be *concluded*." (*Crabb: Eng. Synon.*)

Two bodies may be *close* to each other, but a body is *compact* with regard to itself. Contact is not essential to constitute *closeness*; but a perfect adhesion of all the parts of a body is essential to produce *compactness*. ¶ Crabb thus distinguishes between *close*, *near*, and *nigh*: "*Close* is more definite than *near*; houses stand *close* to each other which are almost joined; men stand *close* when they touch each other; persons are *near* each other when they can converse together. *Near* and *nigh*, which are but variations of each other in etymology, admit of little or no difference in their use; the former however is the most general. People live *near* each other who are in the same street; they live *close* to each other when their houses are adjoining. *Close* is annexed as an adjective; *near* is employed only as an adverb or preposition. We speak of *close* ranks or *close* lines; but not *near* ranks or *near* lines." (*Crabb: Eng. Synon.*)

B. *Parliamentary Rules:* The power in certain circumstances of terminating a debate in the House of Commons, whilst yet there are members willing to carry it on for an indefi-

nitely long period. The British House of Commons is the model on which all similar deliberative assemblies elsewhere have been formed; yet sooner or later every one of these has found it impossible to carry on the business brought before it unless it has assumed to itself the power of deciding when a debate has lasted long enough, and should terminate. Many years went by, and still the good sense and moderation of the successively defeated minorities in the British House of Commons rendered it unnecessary to take any steps for the curtailment of superfluous debate. Not till nearly four-fifths of the nineteenth century had run its course, was any serious desire felt on either side of the House to alter this happy state of things. Shortly before that time, however, the device of obstructing simply for obstruction's sake began to be cultivated as an art, and was brought in a brief period to high perfection. Day by day time was intentionally wasted by small minorities of the house, and oftener than once when the members wished to go home, a section of the Irish representatives forced upon them "an all-night sitting." New rules were adopted, in 1882, to overcome this difficulty. The first rule gave permission to the Speaker, or to the Chairman of a Committee of the whole house, to close debate and go on to vote on a question if, when a motion to that effect was carried by a majority, its supporters appeared to amount to 200, or, in the event of the minority being less than 40, to amount to more than 100. These rules were altered in the direction of greater stringency by the Conservatives in 1887. Whatever is under discussion, the usual form for putting the closure now is "that the question be now put," and it is voted upon without debate. The word closure has not been adopted in the Congress of the United States but similar methods of delaying business have long existed, and rules have recently been adopted in the House to overcome them. The old rules exist in the Senate, and obstruction may go on there unchecked.

B. *Technically:*

1. *Botany:* Cloudberry (*Rubus chamæmorus*).

2. *Meteorology:*

(1) *Composition of clouds:* A cloud is a mass of vapour condensed into minute drops or vesicles, and differing from fog chiefly in this respect, that fogs occupy the lower whilst clouds float in the upper regions of the atmosphere. Both derive their origin from vapours which rise from the sea, from fresh water, or from the moist earth.

(2) *Different kinds of clouds:* In 1803, Mr. Luke Howard divided clouds into four principal kinds, the Cirrus, the Cumulus, the Stratus, and the Nimbus. Two of these are frequently combined: hence he added to the former list of clouds the three following — Cirro-cumulus, Cirro-stratus, and Cumulo-stratus. The Cirrus is a small fibrous or wisp-like cloud, composed of what are popularly called "Mares'-tails," so high in the heavens that they are probably frozen. Their appearance in numbers often precedes a change of weather. The Cumulus, resembling great mountains of wool, is not so high. Several large ones are often seen on a summer morning. If these diminish during the day, the probability is in favour of fine weather, but if they multiply, and become surmounted by Cirri, the indication is of approaching storm. Cumuli in winter are not so frequent or well marked. The Stratus is a large and continuous sheet of dark cloud, seeming to rest on the horizon at sunset, and often vanishing at sunrise. The Stratus is frequent in autumn and rare in spring. The foregoing three all melt into one to form the fourth, viz., the Nimbus, or rain-cloud. Its appearance is familiar to all. The Cirro-cumulus is, as its name imports, a combination of the Cumulus and the Cirrus. It consists of a series of small round masses. The sky covered with them is popularly known as a "Mackerel" sky. It is best seen in warm and dry summer weather. In the Cirro-stratus the Cirri have descended from their airy height and become horizontal. The aspect is like that of shoals of fish. The Cumulo-stratus is like a cumulus flattened at the top and overhanging its base. Its tendency is to spread, settle down into a nimbus, and ultimately disappear in rain.

(3) *Height of clouds in the sky:* The mean height of clouds in winter is from 1,300 to 1,500 yards, and in summer 3,300 to 4,400. M. D'Abbadie observed a cloud in Ethiopia only 230 yards above the ground; and when Gay Lussac ascended in a balloon to a height of 7,650 yards, there were cirri overhead apparently at a much greater elevation.

(4) *Theories of the formation and suspension of clouds:* According to Hutton, while the temperature of a stratum of air saturated with moisture diminishes in an arithmetical progression the capacity of retaining the moisture in the form of invisible vapour diminishes in a geometrical one: hence, when the temperature of a saturated stratum of air falls, the formerly invisible vapour takes the aspect of a cloud. There are various opinions as to why it floats. Halley and Saussure considered that each vesicle of water in the sky was hollow, and that consequently it floated like a balloon; a more modern view is that the vesicles are carried upwards by ascending currents of air. Clouds also which appear stationary are really descending slowly; but their lower part being dissipated by more heated strata of air, and their upper parts increased by fresh condensation, their descent is disguised so that they appear stationary. (*Ganot, &c.*)

(5) *Electricity of clouds:* As a rule the clouds are all electrified, some positively and others negatively: in some there is more, in others less, of tension.

II. *Technically:*

1. *Agric.:* Many species of clover are native to the United States, and Europe has 20 or more species. Of the several kinds grown, the common red clover (*Trifolium pratense*) is a biennial, and may be sown with barley, oats, or other grain sufficiently advanced in growth not to be suffocated by it. In the second year it gives a full crop.

The white, called also Dutch clover, is a perennial, and is sown with various grasses when it is intended as permanent pasture for sheep. French clover (*Trifolium incarnatum*) is ripened early; it is only an annual. Rye-grass in small quantity is often sown along with clover. A crop of clover, if mown and carried away as hay, so impoverishes the land that it should not be repeated for some years, but if it is eaten off the land by sheep fed on oil-cake it is generally grown every four years. [ROTATION OF CROPS.]

2. *Chem.:* The addition of lime and gypsum to the soil greatly promotes the growth of clover. The ash of clover contains 24·9 potash, 3·0 soda, 12·2 magnesia, 34·9 lime, 7·35 phosphoric acid, 3·7 sulphuric acid, 1·3 silica, 1·5 peroxide of iron, 11·1 chloride of sodium. The dried plants yield 10·58 per cent of ash. Clovers contain about 80 per cent of water.

Another definition, interesting at all events, is suggested by Carlyle in the extract given below.

¶ The earliest London club of any celebrity was established about the beginning of the 17th century, at the Mermaid Tavern, Friday Street. Among its members were Shakespeare, Sir Walter Raleigh, Beaumont, Fletcher, and Selden. Ben Jonson figured at another club, which met at the Devil Tavern, near Temple Bar. Of other clubs, the Literary one, established in the year 1764, had among its members Johnson, Boswell, Burke, and Goldsmith. There are numerous clubs in the cities of the United States, such as social, literary, historical, scientific, military, dramatic, mercantile, agricultural, sporting, political, &c. Some of these were of Colonial origin, and others are based on colonial institutions, but the great majority of them are of recent origin and purpose.

Towards the close of the 18th century, the French political clubs gained world-wide notoriety from the active part which they took in the first French revolution. The most celebrated was the Jacobin Club, founded at Versailles in 1789, and called originally the Breton Club. This and other political French clubs were abolished on September 4th, 1797. They were revived in 1848, but were suppressed again in 1849 and 1850.

"Bodies of Men uniting themselves by a Sacred Vow, 'Gelübde';—which word and thing have passed over to us in a singularly dwindled condition: '*Club*' we now call it; and the vow, if sacred, does not aim very high."—*Carlyle: Fred. Great*, bk. ii., ch. 6.

Clû'-nĭ-ăc, *a.* & *s.* [Lat. *cluniacensis.*]

A. *As adj.:* Of or pertaining to Cluny, a commune and town of France, in the department of the Saône-et-Loire, 200 miles S.S.E. of Paris, and seat of the monastery described under B.

B. *As subst.:* A monk belonging to the monastery founded at Cluny, or the order which subsequently developed from it. In 910, Guillaume (William) I., Duke of Aquitaine and Count of Auvergne, and Bern or Berno, Abbot of Gigniac, under his auspices, founded in Cluny, then a mere village, an abbey of Benedictine monks. In the 10th century, Odo, a French nobleman, being made Abbot of Cluny about 927, rendered the discipline of the monastery more strict. Many other monasteries followed the example, and the Cluniacensians became celebrated through Europe, and soon acquired great wealth and power. In the 11th century they founded a community or congregation, separate from that of the ordinary Benedictines. In the 12th century they were corrupted by the wealth they had acquired, and their discipline became greatly relaxed.

About 1077 or 1078, William, Earl of Warren, son-in-law of the Conqueror, brought Cluniac monks into England, and erected for them a house at Lewes, in Sussex. In 1525, Cardinal Wolsey dissolved four houses of Cluniacs. The monastery at Cluny itself was three times plundered by the Huguenots, and during the French revolution of 1789 it was almost entirely destroyed.

Yarrell enumerated five species as British, viz., *Clupea pilchardus* (the Pilchard, or Gipsey Herring); *C. harengus* (the Herring); *C. Leachii* (Leach's Herring); *C. sprattus* (the Sprat, Garvie Herring, or Garvie), and *C. alba* (the Whitebait), but there is reason to believe that the last so-called species is only the young of the herring.

Bot.: Balsam-tree, a genus of plants, the typical one of the order Clusiaceæ (Guttifers), and the tribe Clusieæ. The flowers are usually polygamous, calyx consisting of four imbricate permanent sepals, coloured, the outer pair smallest, often bracteate at the base. Petals 4—6, deciduous; stamens in the male flowers many and free, in the female ones few, sterile, and connected, all glutinous; stigmas 5—12, radiately peltate, glutinous; ovary surrounded by a staminiferous ring; capsule fleshy, 5—12 celled. The species are trees or shrubs, often parasitic. *Clusia rosea* is a beautiful tree growing on rocks; its fruit divides into eight portions, with scarlet seeds like those of the pomegranate. *C. alba* is an elegant tree of great thickness of trunk, yet, strange to say, parasitic upon other trees. *C. flava* resembles the former one. All these, with *C. venosa*, are found in British greenhouses. They were introduced from the warmer parts of America.

Bot.: An order of plants, the type of the alliance Guttiferales, that term implying that they secrete "guttæ," *i.e.*, drops of resin. Lindley calls the Clusiaceæ themselves Guttifers. They have coriaceous leaves, which are simple, opposite, and without stipules, the midrib being generally prominent, and parallel veins at times running conspicuously to the margin. The flowers are symmetrical, with equilateral petals, adnate, beakless anthers, solitary, or few seeds and sessile radiating stigmas. The order consists of trees often parasitical. They are found in the tropics, their metropolis being South America; a few are from Madagascar or

from the Continent of Africa. Many secrete an acrid purgative yellow gum-resin. The gamboge of commerce is furnished by Garcinia, which is a Guttifer. The order contains four tribes: Clusieæ, Moronobeæ, Garcinieæ, and Calophylleæ. In 1845 Lindley enumerated thirty genera, and estimated the known species at 150.

Anat. & Physiol.: When blood is drawn and allowed to stand it emits a "halitus" or exhalation, which has a faint smell. In three or four minutes a film overspreads the liquid, commencing at the circumference and gradually spreading to the centre. Two or three minutes later the lower part of the blood, in contact with the vessel, becomes solidified, and then the whole mass, only about eight or nine minutes being needful for the whole process from first to last. In about fifteen or twenty minutes a thin serum begins to exude from it, and goes on to do so for two or three days. (*Quain.*)

(6) *To haul* (or *bring*) *over the coals:* To scold, to call to account.

II. *Technically:*

1. *Min.:* A carbonaceous mineral substance, black, shiny or dull, easily broken, often splintery, inflammable, and used for fuel. It is composed of carbon (75 per cent.), hydrogen, oxygen, and some nitrogen, with siliceous and other earthy impurities (ash). It consists of compressed and chemically altered vegetable matter, chiefly extinct kinds of lycopodiaceous trees. As the successive jungle-growths [Coal-measures] accumulated their stems, leaves, and spores, hydrogen and oxygen were evolved with some of the carbon. The relative proportion of carbon in the mass was increased, the woody fibre reduced in volume to one-ninth, or even one-fifteenth, of its original bulk, and the mass became black, shiny hydrocarbons, with imbedded charcoal ("mother-coal"), due to decomposition of trees lying exposed to the air, or dull black hydrocarbons, resulting from the consolidation of decomposed vegetable pulp, like soft peat.

¶ Dana divides what may be called the species, termed by him Mineral Coal, into the following varieties: (1) Anthracite, (2) Native Coke, (3) Caking Coal, (4) Non-caking Coal, (5) Cannel Coal (Parrot Coal), (6) Torbanite, (7) Brown Coal (Lignite). (8) Earthy Brown Coal, (9) Mineral Charcoal. The first variety has only 3—46 per cent. of bituminous matter, the second has none, and the rest vary in this respect.

2. *Geol.:* Geologically coal occurs as a stratified rock, interbedded with clays, ironstones, sandstones, and limestones, in what are termed coal-measures. The best coals belong to the Carboniferous series of the Palæozoic system; but much coal of later (Neozoic) ages is found in various parts of the world, though, in that case, either mixed with or passing into lignite, a far less valuable fossil fuel, because little of the hydrogen, oxygen, and nitrogen has been eliminated by chemical change, and thus as much as 30 per cent. of water remains in lignite, while good coal has seldom more than 5 per cent. When lateral pressure has come into operation on the coal-measures, more hydrogen (with some carbon) has been driven off, and the coal metamorphosed into anthracite, which has 90 per cent. of carbon. Some coals have become merely anthracitic. Other coals have had very much carbon ("mother-coal") in them originally. Hence the conditions producing "Steam-coal," that is, either (1) coal good for raising steam quickly, or (2) smokeless coal, suited for steam-ships. According to the decomposition of the vegetable matter, and the resulting combinations of carbon and hydrogen, fossil fuel is more or less bituminous when burnt.

3. *Comm.:* The following are the chief kinds of coal and associated carbonaceous substances used in trade and manufactures:—

(1) Highly bituminous (Gas-coals): Albertite, produced (like rock-oil, &c.) from coal by natural causes; Dysodil or Tasmanite, and "Better-bed" coal, made up of spores; Cannel, Parrot coal, Boghead coal, Torbanite—vegetable matter much altered.

(2) Common bituminous (Household coals): Caking, Coking, Cherry, Splint, and other coals—layers of charcoal ("mother-coal") and hydrocarbon.

(3) Semi-bituminous (Free-burning Steam-coals): (*a*) Charcoal, abundant in original formation; (*b*) Hydrogen and carbon partially lost by chemical changes.

(4) Anthracitic (Steam-coal, &c.): Hydrocarbon nearly all lost by change.

(5) Anthracite: All the hydrocarbon lost by pressure, &c.

(6) Coke: (*a*) Natural, and (*b*) Artificial—hydrocarbon lost by direct heat.

¶ Enormous beds of coal exist in the United States, principally of the bituminous variety, though this country possesses what are probably the largest deposits of anthracite in the world. The entire area of these coal beds is about 200,000 square miles, being 83 times as great as those of the British Islands. The quantity of coal mined in the United States is small in proportion to the size of the beds, but is annually increasing.

A mass of coal when broken splits in three directions: (1) Along the planes of bedding, commonly presenting dull black surfaces which soil the fingers. (2) Vertically across the stratification; the broken surfaces are bright and smooth, and do not soil the fingers; the direction along which these joints run is known as the "face" of the coal. (3) A third set of planes at right angles to both of the other sets, and less perfect, so that the fracture here is more irregular; this direction is called the "end" of the coal. Thus it yields blocks more or less regular in shape, and roughly resembling cubes or dies. (*Huxley: Physiography,* ch. xiv., p. 298, 3rd. ed.)

It was the only fish found by Lord Mulgrave on the shores of Spitzbergen. . . This fish has more provincial names than any other species, some of which only refer to it when of a peculiar size. coal-gas, *s.* A mixture of gases produced by the destructive distillation of coal at regulated temperatures. It is used in lighting streets, houses, &c., and for cooking and heating purposes. Coal-gas is colourless, and has a disagreeable smell. It is purified from H_2S by ferric hydrate, which is moistened with $FeSO_4$ and H_2SO_4 to remove ammonia. The carbon disulphide can be removed by passing it through an iron tube filled with iron turnings and heated to redness. Coal-gas consists of a mixture of hydrogen, 40 to 50 per cent., carbon-monoxide about 5 per cent., marsh gas (CH_4) about 40 per cent., which contribute nothing to the illuminating power of the gas; it depends upon the presence of heavy hydro-carbons, principally C_2H_4 ethene, ordinary gas containing about 4 per cent., and cannel gas about 8 per cent. Coal-gas also contains small quantities of acetylene, butylene, &c., and aromatic hydro-carbons, as benzene, &c. The percentage of nitrogen is very variable, and the CO_2 is nearly all removed from gas made in England. When gas is burnt a large quantity of water is formed, hence, if a gas stove is used to dry a room, there must be sufficient ventilation to carry off the aqueous vapour. The sulphur in coal-gas is converted into sulphuric acid when burnt, which greatly damages books, furniture, &c. The escape of coal-gas from pipes into the soil is very injurious to the roots of trees and shrubs. The admixture of a very small quantity of air greatly impairs the illuminating power of coal-gas. Three causes are capable of decreasing the luminosity of flames, viz.: (1) withdrawal of heat; (2) dilution; and (3) oxidation of luminous material. (See FLAME, *Watts: Dict. Chem.*, 3rd Suppt., p. 787.)

coal-gum, *s.* The dust of coal. (*Scotch.*)

coal-measure, *s.*

1. *Ord. Lang. (Sing.):* The measure used in ascertaining the quantity of coal.

2. *Geol. (Pl.):* Strata of coal with the attendant rocks. If the great Carboniferous formation be separated into three divisions, these, in the descending order, are (1) the Coal-measures, (2) the Millstone-grit, and (3) the Mountain or Carboniferous Limestone. If by the omission of the Millstone-grit they be reduced to two, then the Coal-measures constitute, with the Mountain Limestone already mentioned, the whole Carboniferous formation. In the United States the Coal Measures attain an unusual development, equalled nowhere else in the world. The strata here are divided into two groups. One of these, the Lower or Sub-Carboniferous, corresponds to the Carboniferous limestone of England. The upper groups, comprising the Carboniferous proper, includes the Millstone-grit and the Coal Measures. According to Professor Dana, the coal-bearing area of North America is approximately as follows:

	Sq. miles.
Rhode Island area	500
Alleghany area	59,000
Michigan area	6,700
Illinois, Indiana, West Kentucky	47,000
Missouri, Iowa, Kansas, Arkansas, Texas,	78,000
Nova Scotia and New Brunswick	18,000
Total,	209,200

This table does not include the coal fields of the Rocky Mountains and Pacific States, nor those of Vancouver Island, which would add considerably to the sum total. It is worthy of note that Coal Measures have been detected in the Arctic regions, in several localities. The Coal Measures are largely developed in several parts of Europe, in China, and elsewhere. They are large and rich in England, in comparison with the area of the island, and to the coal produced from them is due much of the prosperity of that kingdom. The measures there comprise fresh water beds, including the Upper and the Middle Coal Measures, and Marine Beds, the Gannister Beds or Lower Coal Measures.

"The black shales of the *coal-measures* are here distilled for various mineral oils and paraffin."—*Anster Short Trip in Hungary and Transylvania*, p. 150.

coal-mining, *a. & s.*

A. *As adj.:* Adapted for or occupied in mining.

B. *As subst.:* The act or process of mining for coals.

Mining: Coal-beds usually lie at a slight slope, and, when reached from the surface by shafts, are dug out together with sufficient of the upper and under strata to allow of vertical room for the miner. At the foot of the pit long galleries (boards) are cut to the extent of the property, then cross galleries (narrows), marking out square spaces or districts (panels). These are dug away, and the coal picked out and removed; the solid intervals, gradually reduced to walls and pillars, are ultimately removed, wooden props supporting the roof until it is allowed to fall in. This is called the "pillar and stall," or "board and pillar," working, and was invented by Mr. Buddle in the beginning of this century. Formerly the coal was removed from the sides of intersecting galleries at the beginning of the mine, or the "rise end" of the seam; and great pillars were left behind comprising nearly sixty per cent. of the coal. Sometimes the hewing is begun at the "rise end" of the "winning," in a gallery all along the edge or face of the coal-seam, which is then cut gradually away, and the roof of the hollow behind is partly supported by stones and timber for roadways, and partly allowed to fall in. This is the "long-way," or "long-wall," plan. The methods and terms vary in different coal-fields. Ventilation is secured by a second shaft (engine-pit or upcast-pit), and by longitudinal divisions (brattices), making double currents, in shafts and galleries; by stoppings and trapdoors regulating the direction of the draught, and by other appliances. Mines are termed "fiery" when carburetted-hydrogen gas issues from the coal. This is frequently continuous; sometimes, when reservoirs are opened, sudden, and then, if the miner has a naked light instead of a Davy or safety lamp, the usual accidents take place.

coal-naphtha, *s.* An oily liquid obtained by the distillation of coal-tar. It is sold as benzole (q.v.). It is purified by agitating with caustic soda to extract the phenol and cresols; then rectified, by which it is separated into a heavy oil containing much naphthalene, and a liquid which is purified by agitation with sulphuric acid and redistilled. By fractional distillation it yields first a mixture of benzene and carbon disulphide, and olefines, &c., at 80° chiefly benzene C_6H_6, about 113° toluene, at 142° xylene, and at 170° impure cumene.

2. *Mining:*

(1) The cylindrical cast of a tree formed of solid sandstone, its mass increasing gradually towards the base, and with no branches left to support it in its position. When cohesion of the external layer, which alone holds it up, is overcome by the force of gravity, the "coal-pipe" falls perpendicularly or obliquely, often crushing unhappy miners at work below. (*Lyell.*)

"These fossil stumps are not uncommon in the roofs of the coal-seams. In some places they are known to the miners as '*coal-pipes.*'"—*Dawson: Earth and Man*, 1873, ch. vi., p. 141.

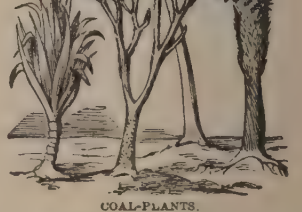
coal-plants, *s.pl.*

Geol.: Plants, the remains of which are found in the strata of the coal-formation, and from the stems, leaves, roots, &c., of which coal itself has been produced. Brongniart has figured upwards of 300 species. They are often in a state of high preservation, exhibiting the most delicate nervures of the leaves, and cortical markings of the stems. (*Craig*, &c.)

¶ Of the most common coal plant-remains, Stigmaria was conjectured by Prof. Brongniart and Sir William Logan to have a relation to Sigillaria, and Mr. Binney proved it to be the roots of that plant by finding the two in actual continuity. (*Q. J. Geol. Soc.* II. (1846), pt. ii., p. 370—373.) Mr. Richard Brown, of Nova



COAL-PLANTS.

Scotia, also saw a probable Sigillaria with Stigmaria roots. (*Ibid.*, 393—6.) What Sigillaria itself is has been a matter of dispute. Brongniart, Göppert, and Unger consider it as probably a cycad. Sir J. Dawson, of Montreal, thinks that this may be its affinity, or that it may be a connecting link between the Gymnosperms and the higher Acrogens. (*Q. J. Geol. Soc.*, XV. (1859), pt. i., p. 76.) Mr. Carruthers, F.R.S., &c., of the British Museum (Natural History), considers it one of the Lycopodiaceæ, and consequently an Acrogen. He places Calamites under the Equisetaceæ, and thinks that Asterophyllites, Annularia, and Sphenophyllum are the leaves of three species. Akin to it is the genus Volkmannia. It is generally agreed that Lepidodendron should be placed under the Lycopodiaceæ. Among the plants of undisputed affinity are ferns of various genera: Sphenopteris, Pecopteris, Neuropteris, Cyclopteris, &c., but with the fructification as a rule destroyed. There are also genuine Conifers in the Coal-measures which probably grew upon the hills whilst the plants previously described had their habitat on the plains. (*Carruthers: Lect. before the*

Royal Institution, on April 16, 1869. *Q. J. Geol. Soc.* XXV. (1869), pt. i., pp. 248—253.)

coal-tar, *s.* Tar produced in the destructive distillation of bituminous coal. It is a thick, sticky, dark-coloured substance, and is used in the manufacture of printer's ink, for asphalt pavements, coating ships, &c. The composition of coal-tar varies according to the temperature at which the coal is distilled, the higher the temperature the larger being the yield of solid bodies. Coal-tar when distilled first gives off gas, then water containing ammoniacal salts, then a brown light oil which, when purified, is called coal-naphtha (q.v.); at higher temperatures a yellow, heavy, fœtid oil called dead-oil (q.v.), or kreasote oil, then naphthalene (q.v.); afterwards the black residue in the retort solidifies on cooling and forms pitch, which is used to form asphalt, and a black varnish to protect iron from rust. If the distillation is continued the pitch yields a yellow substance like butter, containing anthracene, phenanthrene, fluorene, &c.; afterwards, at red heat, a bright orange powder, consisting chiefly of pyrene $C_{16}H_{10}$ and chrysene $C_{18}H_{12}$; the residue forms a hard, porous coke.

Bot.: A genus of plants, order Polemoniaceæ (Phloxworts). The species are fast-growing climbers, with tendrils. *Cobæa scandens*, the best known species, is from Mexico. It grows here in conservatories, or may be made to run up the front of a house with rough walls.

Bot.: An order of plants founded by Don, but now merged in Polemoniaceæ.

cō'-bălt, *s.* [Fr. *cobalt;* Ger. *kobalt, kobolt*, from Kobold, the demon of the German mines; M. H. Ger. *kobolt* = a demon; Low Lat. *cobalus*=a mountain sprite; Gr. κόβαλος (*kobalos*) = a mischievous goblin. A name given to the ore by the miners from its being so poisonous and troublesome to them. It is found in a marcasite frequent in Saxony.]

1. *Chem.:* A metallic element, atomic weight 59, symbol Co. The metal was first obtained in an impure state by Brandt, in 1733. It occurs as speiss cobalt, or tin-white cobalt $CoAs_2$, and cobalt-glance CoAsS. Cobalt occurs in meteoric iron. The ore is first roasted to expel the arsenic, then dissolved in aqua regia, the excess of acid evaporated off; H_2S is then passed through the solution to precipitate copper, bismuth, and the remainder of the arsenic; the filtered liquid is boiled to expel the excess of H_2S, boiled with HNO_3 to convert the iron into a ferric salt; it is then supersaturated with ammonia, which precipitates the iron as $Fe_2(HO)_6$, and the cobalt and nickel remain in solution. Cobalt can be separated from nickel by Rose's process. The solution of the mixed oxides is dissolved in HCl; the solution is diluted with much water, and supersaturated with chlorine gas, which converts the cobaltous chloride $CoCl_2$ into cobaltic chloride Co_2Cl_6, while the nickel is unaltered; excess of barium carbonate $BaCO_3$ is then added, and left to stand for eighteen hours, when the cobaltic oxide is precipitated; the nickel remains in solution. The precipitate is dissolved in boiling HCl, and Na_2SO_4 is added to precipitate the barium as $BaSO_4$, and the cobalt is then precipitated as $Co(HO)_2$ by caustic soda. The metal is obtained by heating cobaltous oxalate in a covered crucible. Metallic cobalt is a hard, magnetic, ductile, reddish-grey metal, with a high melting point. Its sp. gr. is 8·9. It is not easily oxidised by the air, when pure. It is dissolved by dilute HCl or H_2SO_4 with evolution of hydrogen. Cobalt forms two oxides: Cobaltous oxide CoO and Cobaltic oxide Co_2O_3 (q.v.). The alloys of cobalt are unimportant. Zaffre is an impure oxide of cobalt prepared by roasting cobalt ores with twice their weight of sand. Smalt is prepared by fusing partially roasted cobalt ores with a mixture of powdered quartz and potassium carbonate; while hot it is poured into water and then ground to a fine powder; it is used as a pigment; this colour was known to the ancients. The cobaltous salts are the most stable in which cobalt acts as a dyad element. Cobalt compounds give a blue colour to a borax bead.

2. *Min.:* There is no native cobalt known, but many ores of the metal. *Arsenate* or *Arseniate of Cobalt* = Erythrite; *Arsenical Cobalt* = Smaltite; *Black Cobalt* = Asbolite; *Bright-white cobalt* = Cobalt-glance; *Carbonate of Cobalt* = Remingtonite; *Earthy Cobalt* = Asbolite; *Grey Cobalt* = Smaltite; *Red Cobalt* = Erythrite; *Sulphate of Cobalt* = Bieberite; *Sulphuret of Cobalt* = Syepoorite, Linnæite; *White Cobalt* = Smaltite; *Cobalt and Lead Selenite* = Tilkerodite.

It is a greenish-grey powder which, when heated in the air, takes up oxygen and is converted into a black mixed oxide Co_3O_4, which at a stronger heat gives off oxygen. It is used in preparing blue pigments for china painting.

cobaltous salts, *s. pl.*

Chem. : Cobaltous salts are precipitated by sulphide of ammonium as CoS (see analysis), and can be separated from other sulphides of this group, except nickel sulphide, by the insolubility of CoS in dilute HCl. Potash precipitates a blue basic salt, which turns green on exposure to the air ; on heating the precipitate it is converted into the red hydrate $Co(HO)_2$, which is insoluble in excess of RHO, but soluble in ammonia, forming a red brown solution. Small quantities of cobalt salts can be detected by adding cyanide of potassium in excess, then nitrite of potassium, and afterwards acidifying with acetic acid, an intense red cherry juice coloured liquid is formed. Cobalt salts give a blue colour to a borax bead.

whence it is sometimes called the Spectacle Snake. The common name is, however, the Portuguese one, *Cobra, Cobra capella, Cobra de* or *di capello*, borrowed from our predecessors in India. The Hindoos call it Nag, a word which occurs in Nagpore, a city formerly the capital of the Bhonsla dynasty of Mahrattas in Central India. It is from two to four or even six feet long, is common in India, and is so venomous that it causes the death of more people than does the tiger. Notwithstanding this, it is kept in various temples, fed with milk and sugar, and worshipped. Many cobras are killed and eaten by a small mammal, one of the Viverridæ. *Herpestis griseus*, called in India the Mungoos

cobra poison, *s.*

Chem.: The poison of the Cobra de Capello (*Naja tripudians*) may be obtained by pressing the parotid glands of the snake while its fangs are erected. It has been examined by A. Pedler and by A. W. Blyth. It is an amber-coloured, syrupy frothy liquid. Sp. gr. 1·046. It has a feeble acid reaction. The cobra poison contains albumen, a minute trace of fat, and a crystalline body called Cobric acid (q.v.). It dries up, on exposure to the air, to a yellow acrid pungent powder.

Cobric acid crystallises in needles, which are deadly poisonous; it forms about 10 per cent. of the snake poison. It forms a platinum salt, having the composition $(C_{17}H_{35}N_4O_7{\cdot}HCl)_2\,PtCl_4$. The platinum salt is much less poisonous. The addition of potassium permanganate is said to destroy the physiological activity of the poison.

Bot. & Pharm.: The dried leaf of *Erythroxylon Coca*, a shrub, 4—8 feet high, growing wild in Peru, and cultivated there on the Andes, between 2,000 and 5,000 feet high. It constitutes a stimulant which tends to enslave those who use it to a greater extent, it is said, than opium in China or strong liquor here. It is used chiefly by the Peruvian miners, who chew its leaves mixed with the ashes of *Chenopodium quinoa*. It is said to give them great power of enduring fatigue on a scanty supply of food; thirty million pounds of the dried leaves are consumed annually. The leaves contain an alkaloid Cocaine (q.v.), a variety of tannic acid, and a waxy substance called Coca-wax $C_{33}H_{66}O_2$, which melts at 70°.

It was said that Cocceius finds Christ everywhere and Grotius nowhere in the Old Testament. The statement about Cocceius was correct: that regarding Grotius was not so. The followers of Cocceius were for a considerable time numerous and influential. (*Mosheim: Ch. Hist., Cent. XVII., &c.*)

Palæont.: A genus of ganoid fishes, section Placodermata, sub-order Ostracostei. They have, however, affinities, as Prof. Huxley has pointed out, to the Teleostean Siluroids, with which, perhaps, they should be placed. There is a cephalic buckler covered with small hemispherical tubercles, the notochord was persistent, but the rays of the dorsal and ventral fins, as well as the neural and hæmal spines, are ossified. The tail was heterocercal. Coccosteus is a very characteristic organism of the Old Red Sandstone, occurring at Gamrie, in Orkney, Caithness, &c. It is found also in the Eifel country and in the Hartz. The genus seems to have come into existence, however, in the Upper Silurian; species of that age having been found by M. Barrande in Bohemia.

Bot.: A genus of plants, order Menispermaceæ. Sepals 6 in 2 whorls, petals 6, stamens 3 or 6, ovaries 3, 6, or more; drupes one-celled, one-seeded. The genus consists of climbing plants with small, generally white or green, dioecious flowers and heart-shaped leaves. In general the species are bitter febrifuges. *Cocculus crispus*, a twining species with tubercles or warts on the stem, found in Sumatra and the Mollucca Islands, is used by the Malays in intermittent fevers. The root of what was formerly called *Cocculus palmatus* but is now designated *Jateorhiza palmata*, found in Mozambique and Oibo, is the Calumba-root of commerce, from which a bitter is obtained. [Calumba.] A decoction of the fresh roots of *C. villosus*, with a few heads of long pepper in goat's milk, is administered by the Hindoos in rheumatism and old venereal complaints, as is a green jelly for heat of urine. An ink is made from its fruit. In Arabia a spirit is distilled from the acrid berries of *C. Cebatha.*

cocculus indicus, *s.*

Comm., &c.: A popular name given to a species of Menispermaceæ, which furnishes certain dried berries constituting an article of commerce. They are imported into this country from the East Indies. There is no botanical species with this exact name. The plant which furnishes the berries, the *Menispermum Cocculus* of Linnæus, was called by De Candolle *Cocculus suberosus*, but Wight and Arnott have since removed it from the cocculus genus, and term it *Anamirta Cocculus.* The drupe resembles a round berry, the size of a pea or larger, wrinkled externally, and with a brittle husk. The kernel is intensely bitter. It contains about one-fiftieth of its weight of a powerful bitter narcotic poison called Picrotoxin (q.v.), also bases called Menispermine $C_{18}H_{24}N_2O_2$, a crystalline base, Paramenispermine, and several organic acids, &c. *C. indicus* is a deadly poison, is used to give a bitter taste to beer, and is thrown into rivers to kill the fish. It has been used in form of ointment in certain skin diseases. The popular notion that these berries were used to increase the intoxicating properties of porter is said, on the authority of an eminent analyst, to be erroneous.

1. *Entom.:* The typical genus of the family Coccidæ (q.v.). Many species are hurtful to plants in greenhouses and elsewhere. Gardeners call them bugs. *Coccus adonidum* (the Mealy Bug) does damage in hothouses, as does *C. Testudo*. *C. Vitis* (the Vine-scale) injures vines, and *C. Hesperidum* oranges. They may be destroyed by painting the branch on which they congregate with spirits of turpentine, or fumigating them with turpentine, tobacco, or sulphur. Others, however, are of value as dyes. *C. Cacti*, found on the Cactuses, is the Cochineal Insect. [Cochineal.] *C. Ilicis*, found on *Quercus coccifera*, an evergreen oak in the south of France, furnishes a crimson dye which has long been known to mankind. *C. Polonicus* is used by the Turks as a red dye. *C. Lacca* yields lac. [Lac.]

They have a large head, ornamented with a folding or procumbent crest, a short very broad bill with the culmen of it very much curved. The tail is lengthened and broad, the feathers not narrowed. Besides their peculiar utterance "cockatoo," from which they derive their name, screamed out harshly, they are not able to acquire more than a few words, their imitative power being but slight. They inhabit Australia and the Eastern Islands, living in woods, and feeding chiefly on seeds and fruits, which their bills are well adapted to crush. They also eat insects. The species most frequently brought to England are the Great Sulphur-crested Cockatoo, *Cacatua galerita*, and the Small Sulphur-crested Cockatoo, *C. sulphurea.* They are white with yellow crests. They become thoroughly domesticated.

"Here are also—[in the Mauritius] herons white and beautiful:—*cocatoes*, a sort of parrot, whose nature may well take name from κακὸν ὠὸν, it is so fierce and so indomitable."—*Sir T. Herbert: Travels*, p. 383.

cŏck'-a-trĭçe, * cŏc'-a-tryse, * kŏk'-a-trĭçe, *s.* [O. Fr. *cocatrice* = a crocodile; from Low Lat. *cocatricem*, acc. of *cocatrix* = a crocodile, a basilisk: a corruption of Low Lat. *cocodrillus* = a crocodile. "The *r* being dropped, as in Sp. *cocodrilo*, Mid. Eng. *cokedrill*, the fable that the animal was produced from a cock's egg was invented to account for the name." In four of these passages, viz., Prov. xxiii. 32 (margin), Isa. xi. 8, lix. 5, Jer. viii. 17, the word is צִפְעֹנִי (*tsiphōnî*), and in one, viz., Isa. xiv. 29, it is צֶפַע (*tsepha*). Tsiphoni means that which is generated from a serpent, hence a serpent itself. Tsepha, which is from the same root, is a serpent's progeny. It evidently means a very venomous serpent, but it will be observed that no countenance is given in Scripture to the fable about the origin of the cockatrice, or to any other of the myths that of old clustered so thickly around that animal of now fallen fame.
